XX
XX      Functionalized nanocrystal carrying polynucleotide, used for detecting
PT      target analyte, forms dendrimers with complementary nanocrystals to
PT      amplify the fluorescent signal.
XX
XX      Example 3; Page 68; 72pp; English.
XX
XX      The present invention relates to functionalised nanocrystals for use in
CC      nonisotopic detection systems for biomolecules e.g. nucleic acids,
CC      proteins, lipids or drugs. The nanocrystals have polynucleotide strands
CC      attached to their surfaces with one end of the polynucleotide extending
CC      outwardly from the nanocrystal. The present sequence is one such
CC      polynucleotide. These nanocrystals are used with a second series of
CC      nanocrystals, which have polynucleotides complementary to the first
CC      polynucleotides, so that the respective complementary strands hybridise
CC      to each other and form a dendrimer. This dendrimer produces a signal
CC      which can then be detected e.g. fluorescence. The present sequence is
CC      composed mainly of Adenine bases. This sequence may therefore be used
CC      with a polynucleotide composed mainly of Thymine bases (AAA58386)

 PT Identifying agents for treatment or prevention of cytomegalovirus  
 PT infection, comprises contacting test compound with cellular kinase and  
 PT detecting change in cellular kinase activity.  
 XX  
 PS Example 1; Page 13; 49pp; English.  
 XX  
 CC The present invention relates to a new method for identifying compounds  
 CC for treating and/or preventing cytomegalovirus (CMV) infection and/or  
 CC related diseases. The method of the invention comprises contacting a test  
 CC compound with at least one of the cellular kinases RICK, RIP, Nck,  
 CC Interacting kinase, MKK3 and SRPK-2 and detecting any change in kinase  
 CC activity. The method of the invention can be used to treat and/or prevent  
 CC CMV infections and related diseases. Oligonucleotides that can detect the  
 CC specified kinases can also be used for diagnosis of infection. The  
 CC present nucleic acid sequence represents human CMV reverse transcriptase  
 CC (RT)-PCR primer TXN that was used in the methods of the invention for  
 CC preparation of radioactively labelled cDNA probes

PS Example; Page 38; 96pp; English.  
 XX  
 CC The invention relates to novel pyridylpyrimidine derivatives and methods  
 CC of detecting prion infections and/or prion disease in an individual or in  
 CC cells, cell cultures and/or cell lysates. The method involves adding at  
 CC least one monoclonal or polyclonal antibody, oligonucleotide or pyridyl-  
 CC pyrimidine derivative to the sample or in cells, cell cultures and/or  
 CC cell lysates and detecting the activity of at least one human cellular  
 CC protein kinases (e.g. GGF-R1 (also known as fig, Fl-1, Flt-2, b-FGFR),  
 CC Tkt (also known as CCK-2, DDR-2 or EDDR; EC number 2.7.1.112), Abl (also  
 CC known as c-abl), clik, MKK7 (also known as SAPK1a, SAPKalpha), CDC2 (also  
 CC also known as CDK1), PRK), human cellular protein phosphatases such as PTP-SL  
 CC (also known as MCP83) and PTP-zeta, the cellular signal transduction  
 CC molecules HSP80 and GPCR-1. The invention is useful for regulating the  
 CC production of prions in cells and in the manufacture of pharmaceutical  
 CC composition for prophylaxis and/or treatment of infectious disease (e.g.  
 CC Scrapie, chronic wasting disease (CWD), transmissible mink encephalopathy  
 CC (TME), Creutzfeldt-Jacob disease (CJD), bovine spongiform encephalopathy  
 CC (BSE), variant CJD, Gerstmann-Strausler-Scheinker syndrome (GSS), fatal  
 CC familial insomnia (FFI), Kuru and Alpers syndrome, especially BSE, CJD,  
 CC vCJD) or neurodegenerative diseases (e.g., Alzheimer's disease) in humans  
 CC or ruminants. The present DNA sequence is a primer used to prepare  
 CC radioactively labelled cDNA probes from RNA. This sequence is used in the  
 CC exemplification of the invention

XX DR WPI; 2003-712612/67.  
 XX PA New short interfering nucleic acid, useful e.g. for treatment and  
 PT diagnosis of prostatic cancer, downregulates expression of the EZH2 gene.  
 XX PI Example 7; Page 121; 140pp; English.  
 XX PS The invention relates to short interfering nucleic acids (siNA) which  
 XX CC downregulate expression of the human polycomb group protein EZH2 gene by  
 CC RNA interference. The siNAs may or may not comprise ribonucleotides and  
 CC may be double or single stranded. They further comprise a sense and  
 CC antisense regions, or alternatively are assembled from a sense  
 CC oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs  
 CC include short interfering RNA (siRNA), double-stranded RNA, micro-RNA  
 CC (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or  
 CC chemically modified, can contain deoxyribonucleotides, and can be  
 CC chemically synthesised, expressed from a vector or enzymatically  
 CC synthesised. The invention also relates to kits for the in vitro or in  
 CC vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors  
 CC that express siNA. The siNAs are used to modulate expression of the EZH2  
 CC gene in cells, tissue explants or organisms (e.g., by ex vivo gene  
 CC therapy), or in grafts and transplants for the treatment of a variety of  
 CC conditions. They may be used for treating cancer. The siNAs are also  
 CC useful for drug screening, diagnosis, therapeutic target identification  
 CC and validation, genetic engineering, pharmacogenomics, studying gene  
 CC function, and gene mapping (e.g., of single nucleotide polymorphisms).  
 CC The present sequence represents the lower strand of a human EZH2 targeted  
 CC double stranded siNA.

 XX PS New short interfering nucleic acid, useful e.g. for treatment and  
 PT diagnosis of prostatic cancer, downregulates expression of the EZH2 gene.  
 XX PI Example 7; Page 121; 140pp; English.  
 XX CC The invention relates to short interfering nucleic acids (siNA) which  
 CC downregulate expression of the human polycomb group protein EZH2 gene by  
 CC RNA interference. The siNAs may or may not comprise ribonucleotides and  
 CC may be double or single stranded. They further comprise a sense and  
 CC antisense regions, or alternatively are assembled from a sense  
 CC oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs  
 CC include short interfering RNA (siRNA), double-stranded RNA, micro-RNA  
 CC (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or  
 CC chemically modified, can contain deoxyribonucleotides, and can be  
 CC chemically synthesised, expressed from a vector or enzymatically  
 CC synthesised. The invention also relates to kits for the in vitro or in  
 CC vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors  
 CC that express siNA. The siNAs are used to modulate expression of the EZH2  
 CC gene in cells, tissue explants or organisms (e.g., by ex vivo gene  
 CC therapy), or in grafts and transplants for the treatment of a variety of  
 CC conditions. They may be used for treating cancer. The siNAs are also  
 CC useful for drug screening, diagnosis, therapeutic target identification  
 CC and validation, genetic engineering, pharmacogenomics, studying gene  
 CC function, and gene mapping (e.g., of single nucleotide polymorphisms).  
 CC The present sequence represents the upper strand of a human EZH2 targeted  
 CC double stranded siNA, which is identical to the EZH2 transcript target  
 CC sequence.

PT Interference RNA agent useful for treating dyslipidemias, coronary artery
PT disease, diabetes, cancer or neurological disease, comprises sense
PT sequence and antisense sequence which has specific modifications.
XX
PS Example 5; SEQ ID NO 6180; 378pp; English.
XX
CC The invention describes a RNA interference (iRNA) agent (I) comprising a
CC sense sequence and an antisense sequence, where the sense sequences have
CC one or more asymmetrical 2'-O alkyl modifications, the antisense
CC sequences have one or more asymmetrical phosphorothioate modifications
CC and the antisense sequence targets a human gene sequence. Also described
CC are: a pharmaceutical preparation comprising (I); reducing (M1) apoB-100
CC levels or glucose-6-phosphatase levels in a subject; producing (I);
CC stabilising (I), involves selecting a sequence with activity and
CC introducing one or more asymmetrical modification in the sequence, where
CC the modification decreases nuclease sensitivity while not decreasing its
CC activity; a kit comprising (I) and instruction for its use; and a device
CC that can be dispense or administer a composition comprising (I). (I) is
CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)
CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.
CC The subject is suffering from a disorder characterised by elevated or
CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted
CC levels of cholesterol, and/or dysregulation of lipid metabolism. The
CC disorder is chosen from the HDL/LDL cholesterol imbalance,
CC dyslipidaemias, hypercholesterolaemia, statin-resistant
CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart
CC disease (CHD) and atherosclerosis. (I) is administered to a subject to
CC inhibit hepatic glucose production or for treating glucose-metabolism-
CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for
CC treating the diseases as mentioned above, cancer (e.g. breast, colon or
CC lung cancer), neurological disease (e.g., Huntington disease or
CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence
CC represents a hepatitis C virus (HCV) antisense oligonucleotide that can
CC be used to control HCV gene expression.

XX
XX Generating an oligonucleotide for treating diseases, comprises
XX determining from a structure of RNA from an exon, a region that assumes a
XX structure hybridized to another part of the RNA and a region that is not
XX hybridized in the structure.
XX
XX Example 1; Page 88; 117pp; English.
XX
XX The invention relates to generating an oligonucleotide and involves
XX determining from a secondary structure of RNA from an exon, a region that
XX assumes a structure that is hybridized to another part of the RNA (closed
XX structure) and a region that is not hybridized in the structure (open
XX structure), and subsequently generating an oligonucleotide, where at
XX least a part of the oligonucleotide is complementary to the closed
XX structure and at least another part of the oligonucleotide is
XX complementary to the open structure. In generating an oligonucleotide,
XX the open and closed structures are adjacent to each other. The
XX oligonucleotide is complementary to a consecutive part of 14-50
XX nucleotides of the RNA. It also comprises RNA, where the RNA contains a
XX modification, preferably a 2'-O-methyl modified ribose (RNA) or
XX deoxyribose (DNA) modification. The pre-mRNA comprising the exon exhibits
XX undesired splicing in a subject. The absence of the exon from mRNA
XX produced from the pre-mRNA generates a coding region for a protein. The
XX gene from which the RNA comprising the exon is transcribed encodes an
XX aberrant Duchenne muscular dystrophy gene (DMD), a collagen VI alpha 1
XX gene (COL6A1), a myotubular myopathy 1 gene (MTM1), a dysferlin gene
XX (DYSF), a laminin-alpha 2 gene (LAMA2), an emery-dreyfuss muscular
XX dystrophy gene (EMD), and/or a calpain 3 gene (CAPN3). Preferably, the
XX gene is the DMD gene. The oligonucleotide, its equivalent, or the
XX compound is useful for at least in part altering recognition of the exon
XX or exons in a pre-mRNA; for the preparation of a medicament for the
XX treatment of an inherited disease; for inducing exon skipping in a pre-
XX mRNA; for altering exon-recognition in a pre-mRNA; for altering the
XX efficiency with which a splice donor or splice acceptor sequence is used
XX by a splicing machinery; for inducing exon-skipping of two, three, or
XX more exons in a pre-mRNA; or for inducing skipping of the at least two
XX exons and a sequence located between the at least two exons (intervening
XX sequence) on the pre-mRNA, where intervening sequence further comprises
XX exon or exons. Sequences ADS73865-ADS73903 represent antisense
XX oligonucleotides (AONs) used to study targeted skipping of 15 different
XX DMD exons.

XX New antisense oligonucleotide, having a sequence targeted to a nucleic  
 PT acid encoding PCTAIRE protein kinase 2, useful for preparing a  
 PT composition for treating neurological disorders.

XX Claim 1; SEQ ID NO 84; 58pp; English.

XX The invention describes a new antisense oligonucleotide, having a  
 CC sequence comprising 8-80 bp targeted to a nucleic acid encoding PCTAIRE  
 CC protein kinase 2, that specifically hybridises with the nucleic acid  
 CC encoding PCTAIRE protein kinase 2 and having a sequence comprising 20 bp.  
 CC The antisense oligonucleotide is useful for preparing a composition for  
 CC treating e.g., neurological disorders. This sequence represents a human  
 CC PCTAIRE protein kinase 2 antisense oligonucleotide.

XX
CC The invention relates to a novel isolated double stranded RNA
CC oligonucleotide about 19 to about 25 ribonucleotides in length or its
CC equivalent. One strand of the oligonucleotide comprises the same
CC nucleotide sequence as a region of a hepatitis C virus (HCV) target RNA
CC poly-nucleotide sequence required for hepatitis C virus infection,
CC replication or pathogenesis in vitro or in vivo in a host cell. The
CC oligonucleotide of the invention demonstrates virucide activity and may
CC be useful for preparing a composition or vaccine for treating or
CC preventing hepatitis C virus, as well as during gene therapy procedures.
CC The current sequence is that of the HCV coding region-derived conserved
CC RNA sequence of the invention.

PT New double-stranded short interfering nucleic acid comprises sugar-
PT modified pyrimidine bases useful for treating infection with hepatitis C
PT virus.
XX
PS Example 3; SEQ ID NO 305; 183pp; English.
XX
CC This invention relates to novel double-stranded short interfering nucleic
CC acids (siNA) that inhibits replication of hepatitis C virus (HCV), where
CC one strand is an antisense strand (ASS) that is complementary to (part
```

```
CC of) an HCV RNA (portion) and a sense strand (SS) that is complementary to
CC ASS, and where most of the pyrimidine nucleotides comprise a sugar
CC modification. The invention may allow development of compounds with
CC virucide, antiinflammatory, hepatotropic or cytostatic activities by
CC modulation (inhibition) of expression or activity of HCV RNA, by RNA
CC interference. The siNA's of the invention may be used to inhibit
CC replication of HCV, in cells, tissue explants or organisms, for treating
CC HCV infection and its consequences (liver failure; hepatocellular cancer
CC and cirrhosis), and also for drug screening, diagnosis, target
CC identification and validation, genetic engineering, pharmacogenomics,
CC studying gene function and gene mapping (for example of single-nucleotide
CC polymorphisms). The chemical modification improves stability, activity,
CC cellular uptake and/or binding affinity. The siNA can be directed to
CC conserved regions of HCV genes, so are active against many different
CC strains.

PT New RNA molecule less than 49 bases and having a sequence effective to  
 PT mediate degradation or block translation of mRNA that is the  
 PT transcriptional product of a target gene, useful for treating Alzheimer's  
 PT disease or cancer.

XX Claim 4; SEQ ID NO 7; 63pp; English.

PS The present sequence is the sense strand of a short interfering RNA  
 CC (siRNA) targeted to human clusterin. The antisense strand is also  
 CC provided ADL70463. The siRNA can be used to interfere with the expression  
 CC of clusterin. Clusterin, also known as testosterone-repressed prostate  
 CC message-2 (TRPM-2) or sulfated glycoprotein-2 (SGP-2), is expressed in  
 CC increased amounts by prostate tumour cells following androgen withdrawal,  
 CC and has also been shown to be critical for neuritic toxicity in mouse  
 CC models of Alzheimer's disease. siRNAs of the invention can be used alone  
 CC or in combination with other chemotherapy or apoptosis inducing  
 CC treatments for the treatment of prostate cancer, sarcomas such as  
 CC osteosarcoma, renal cell carcinoma, breast cancer, bladder cancer, lung  
 CC cancer, colon cancer, ovarian cancer, anaplastic large cell lymphoma and  
 CC melanoma, and also for the treatment of Alzheimer's disease.

PT New RNA molecule less than 49 bases and having a sequence effective to  
 PT mediate degradation or block translation of mRNA that is the  
 PT transcriptional product of a target gene, useful for treating Alzheimer's  
 PT disease or cancer.

PS	Claim 4; SEQ ID NO 8; 63pp; English.	
XX		
CC	The present sequence is the antisense strand of a short interfering RNA (siRNA) targeted to human clusterin. The sense strand is also provided (siRNA) targeted to human clusterin. The sense strand is also provided ADL70462. The siRNA can be used to interfere with the expression of clusterin. Clusterin, also known as testosterone-repressed prostate message-2 (TRPM-2) or sulfated glycoprotein-2 (SGP-2), is expressed in increased amounts by prostate tumour cells following androgen withdrawal, and has also been shown to be critical for neuritic toxicity in mouse models of Alzheimer's disease. siRNAs of the invention can be used alone or in combination with other chemotherapy or apoptosis inducing treatments for the treatment of prostate cancer, sarcomas such as osteosarcoma, renal cell carcinoma, breast cancer, bladder cancer, lung cancer, colon cancer, ovarian cancer, anaplastic large cell lymphoma and melanoma, and also for the treatment of Alzheimer's disease.

PT Typing genes that contain polymorphic microsatellite loci, useful for  
 PT identifying predisposition to disease, by amplification and determining  
 PT length of amplicons.

XX Example 3; Page 28; 64pp; German.

XX The invention describes a method of typing (M1) a gene (I) that has one  
 CC or more polymorphic microsatellite loci (PML). The method comprises: PCR  
 CC amplification of at least one DNA region of (I) that includes PML, using  
 CC as template a DNA sample containing at least one segment of (I); and  
 CC determining the length of the resulting amplicon(s). Also described are:  
 CC a method of determining (M2) microsatellite markers (NM) for  
 CC predisposition to a disease, associated with a gene that includes one or  
 CC more PML; and prediagnosis (M3) of diseases associated with gene that  
 CC include PML. The method is used to identify microsatellite markers, in a  
 CC disease-related gene, that are associated with a predisposition to  
 CC diseases and for prediagnosis of such diseases, especially prion diseases  
 CC but also cystic fibrosis, malignant hyperthermia syndrome in pigs and  
 CC metabolic diseases; also to type genes that encode milk proteins, and  
 CC hormones or transcription factors. The method is simpler, quicker, and  
 CC particularly less expensive than known methods based on sequencing. This  
 CC sequence represents a primer used to genotype a region of the cow prion  
 CC protein (PrP) comprising a polymorphic microsatellite locus.

PT Interference RNA agent useful for treating dyslipidemias, coronary artery
PT disease, diabetes, cancer or neurological disease, comprises sense
PT sequence and antisense sequence which has specific modifications.
XX
XX Example 5; SEQ ID NO 5367; 378pp; English.
XX
XX The invention describes a RNA interference (iRNA) agent (I) comprising a
CC sense sequence and an antisense sequence, where the sense sequences have
CC one or more asymmetrical 2'-O alkyl modifications, the antisense
CC sequences have one or more asymmetrical phosphorothioate modifications
CC and the antisense sequence targets a human gene sequence. Also described
```

```
CC are: a pharmaceutical preparation comprising (I); reducing (M1) apob-100
CC levels or glucose-6-phosphatase levels in a subject; producing (I);
CC stabilising (I), involves selecting a sequence with activity and
CC introducing one or more asymmetrical modification in the sequence, where
CC the modification decreases nuclease sensitivity while not decreasing its
CC activity; a kit comprising (I) and instructions for its use; and a device
CC that can be dispense or administer a composition comprising (I). (I) is
CC useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M1)
CC is useful for reducing apob-100 levels or glucose-6-phosphatase levels.
CC The subject is suffering from a disorder characterised by elevated or
CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted
CC levels of cholesterol, and/or dysregulation of lipid metabolism. The
CC disorder is chosen from the HDL/LDL cholesterol imbalance,
CC dyslipidaemias, hypercholesterolaemia, statin-resistant
CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart
CC disease (CHD) and atherosclerosis. (I) is administered to a subject to
CC inhibit hepatic glucose production or for treating glucose-metabolism-
CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for
CC treating the diseases as mentioned above, cancer (e.g. breast, colon or
CC lung cancer), neurological disease (e.g., Huntington disease or
CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence
CC represents a human glucose-6-phosphatase antisense oligonucleotide that
CC can be used to control glucose-6-phosphatase gene expression.

 PT New oligo:nucleotide specific for apolipoprotein-J polymorphisms - used  
 PT to identify patients susceptible to Alzheimer's disease or prostate  
 PT cancer.  
 XX  
 PS Claim 27; Page 40; 62pp; English.  
 XX  
 CC AAT41525 is a primer/probe used to detect a J2 allelic variation in the  
 CC human apolipoprotein-J (ApoJ) gene. The primer/probe is used for  
 CC detecting polymorphisms associated with an allelic variation in the ApoJ  
 CC gene. The oligonucleotide (OG) detects the probability of a person  
 CC developing Alzheimer's disease (AD), preferably in patients of African or  
 CC Hispanic descent. The OG also detects the probability of a person  
 CC developing a cognitive disorder, or a prostatic carcinoma. Transgenic  
 CC mammals expressing an allelic variant of an ApoJ gene may be used as a  
 CC prognostic and diagnostic means for studying AD, and to determine the  
 CC effectiveness of therapeutic drugs

 PT Enzymatic nucleic acid molecules having a hammer-head motif - used for  
 PT the treatment of arthritis, induction of graft tolerance or treatment of  
 PT auto-immune diseases.  
 XX  
 PS Example 1; Page 154; 307pp; English.  
 XX  
 CC The present invention describes a novel enzymatic nucleic acid (ENA)  
 CC having a hammerhead motif (HM) comprising: (i) at least 5 ribose residues  
 CC ; (ii) a 2'-C-allyl modification at position 4 of the ENA; (iii) at least  
 CC ten 2'-O-methyl modifications; and (iv) a 3'-end modification. The ENA's  
 CC can inhibit collagenase and stromelysin production in the synovial  
 CC membrane of joints for the treatment or prevention of arthritis.  
 CC particularly osteoarthritis or rheumatoid arthritis. The ENA's can also  
 CC be used to treat antigen presenting cells of a donor to induce tolerance  
 CC in a recipient to an alloantigen of a donor. They can also be used for  
 CC enhancing graft tolerance or for treating autoimmune disease, and for  
 CC treating allergies and other inflammatory conditions. The ENA's can also  
 CC be used in diagnosis. Ribozyme therapy impacts on the expression of  
 CC stromelysin without introducing the non-specific effects upon gene  
 CC expression which accompany treatment with retinoids and dexamethasone.  
 CC The concentration of ribozyme required to affect a therapeutic treatment  
 CC is lower than that required of antisense molecules, and is highly  
 CC specific. The present sequence is used in the exemplification of the  
 CC present invention

 CC This sequence represents a primer of the invention. The invention relates  
 CC to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta  
 CC -N3'; or (X)m5'-(gamma)k-delta-N3'; where X = a labelled compound and/or  
 CC a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n =  
 CC natural number indicating the repetition of alpha; beta = V or N;  
 CC V = adenine, guanine or cytosine; N = adenine, guanine, cytosine or  
 CC thymine; gamma = thymine; k = natural number of 3 or over indicating the  
 CC repetition of gamma, in which thymine expressed by gamma is composed of  
 CC 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are  
 CC useful as primers for RT-PCR and determination of base sequences. The new  
 CC sequences allow for reproductive and highly efficient analysis of gene  
 CC sequences

XX Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense  
PT constructs, which down regulate expression of a CD20 gene or neurite  
PT growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and  
PT central nervous system injury.  
XX Claim 88; Page 68; 200pp; English.  
XX The invention relates to a nucleic acid molecule which down regulates  
CC expression of a CD20 gene and a nucleic acid molecule which down regulates  
CC regulates expression of a neurite growth inhibitor gene (NOGO). The  
CC nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a  
CC DNazyme) an Inozyme (an endolytic nucleic acid cleaving a RNA molecule  
CC possessing an NCR motif), a G-cleaver (cleaving RNA with a NVN motif) or  
CC an amberyne (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA  
CC with a YGY motif). The CD20-targeting nucleic acid is used to cleave RNA  
CC of CD20 in the presence of a divalent cation that is preferably Mg<sup>2+</sup>.  
CC Furthermore, it may be contacted with a cell to reduce CD20 activity of  
CC the cell and treat a patient having a condition associated with the level  
CC of CD20. The treatment may further comprise the use of one or more  
CC therapies. In particular, the CD20 targeting nucleic acid may be used to  
CC treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-  
CC Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic  
CC leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell  
CC lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma,  
CC immune thrombocytopenia, and inflammatory arthropathy. The NOGO-  
CC targeting nucleic acid is used to cleave RNA of the NOGO gene in the  
CC presence of a divalent cation that is preferably Mg<sup>2+</sup>. Furthermore, the  
CC nucleic acid may be contacted with a cell to reduce NOGO activity of the  
CC cell and treat a patient having a condition associated with the level of  
CC NOGO. The treatment may further comprise the use of one or more  
CC therapies. In particular, the NOGO-targeting nucleic acid may be used to  
CC treat central nervous system (CNS) injury and cerebrovascular accident  
CC (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS),  
CC chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS),  
CC Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob  
CC disease, muscular dystrophy, and/or other neurodegenerative disease  
CC states which respond to the modulation of NOGO expression. The present

CC sequence is a hammerhead ribozyme of the invention

XX Dattagupta N;  
XX WPI; 2002-171819/22.  
XX Probes for detecting target nucleotide sequence in sample, has sequence  
PT that forms hairpin structure having a double-stranded segment and single-  
PT stranded loop collectively forming region complementary to target  
PT sequence.  
XX Example 4; Page 49; 72pp; English.  
XX The present sequence is that of DNA-RNA-DNA hybrid oligonucleotide  
CC AGT02014. This is one of a set of oligonucleotides (see ABA91527-30) used  
CC to assess the minimum number of ribonucleotides in DNA-RNA chimeric  
CC oligonucleotides required for RNase H cleavage. Each oligonucleotide of  
CC the set had a different number of ribonucleotides, 1 in the present case.  
CC The oligonucleotides were mixed with target DNA oligonucleotide AGT02009  
CC (see ABA91531) and incubated with RNase H (5 U/ml) at 37 degrees C for 30  
CC minutes. The results showed that 4 ribonucleotides were the minimum  
CC number for RNA cleavage. The invention provides probes for nucleic acid  
CC hybridisation. The probes form a hairpin structure comprising a double-  
CC stranded stem and a single-stranded loop, and are capable of both  
CC intramolecular and intermolecular hybridisation. The double-stranded stem  
CC may comprise a methylphosphonate DNA:RNA hybrid that is resistant to  
CC RNase H cleavage. When the probe hybridises with a target DNA, the RNA  
CC strand in the DNA:RNA duplex becomes sensitive to RNase H treatment and  
CC can be removed. Arrays and methods for nucleic acid hybridisation using  
XX the probes are provided

 PT desorption ionization, comprises human myosin-like protein hGDMPLP-1.  
 XX  
 XX Disclosure; SEQ ID NO 8666; 214pp; English.  
 PS  
 CC The present invention describes a human genome-derived myosin-like  
 CC protein 1 (hGDMPLP-1). The protein and polynucleotide sequences of hGDMPLP-  
 CC 1 can be used in gene therapy and vaccine production. The hGDMPLP-1  
 CC nucleic acids can be used as probes to detect, characterise and quantify  
 CC hGDMPLP-1 nucleic acids in samples, as amplification substrates, to  
 CC provide initial substrates for the recombinant engineering of hGDMPLP-1  
 CC protein variants having desired phenotypic improvements, and for  
 CC expressing the proteins. The hGDMPLP-1 proteins or polypeptides may be  
 CC used as immunogens to raise antibodies that specifically recognise hGDMPLP  
 CC -1 proteins, as standards in assays used to determine the concentration  
 CC and/or amount specifically of hGDMPLP proteins, as specific biomolecule  
 CC capture probes for surface-enhanced laser desorption/ionisation, as  
 CC therapeutic supplement in patients having specific deficiency in hGDMPLP-1

CC production, and in vaccines or for replacement therapy. The  
 CC polynucleotide sequences encoding hGDMPLP-1 may be used for diagnosing a  
 CC disorder associated with the expression of hGDMPLP-1, in particular heart  
 CC and skeletal muscle disorders. hGDMPLP-1 is localised to chromosome 22.  
 CC The present sequence represents an oligomer used in the screening of the  
 CC hGDMPLP-1 sequence in the exemplification of the present invention. N.B.  
 CC The sequence data for this patent did not form part of the printed  
 CC specification, but was obtained in electronic format directly from WIPO  
 CC at ftp.wipo.int/pub/published\_pct\_sequence

 PT Sequential consensus region-directed amplification for sorting mixture of  
 PT DNAs into 2 or more subsets or distinguishing gene expression patterns in  
 PT 2 samples, useful for disease diagnosis and gene analysis.  
 XX  
 XX Example; Fig 1D; 19pp; English.  
 PS  
 CC The invention relates to a method of sequential consensus region-directed  
 CC amplification for sorting a mixture of DNAs into 2 or more subsets or  
 CC distinguishing gene expression patterns in 2 samples. The methods, kits  
 CC and oligonucleotides are useful for sorting a mixture of DNAs into 2 or  
 CC more subsets or distinguishing gene expression patterns in 2 samples e.g.  
 CC for disease diagnosis and gene analysis. The present sequence is oligo AT  
 CC PCR primer used to illustrate the method of the invention

 XX New zinc finger-containing proteins and nucleic acids, useful in  
 PT manufacturing a medicament for treating or preventing a disorder  
 PT associated with decreased or increased expression or activity of MDZ3,  
 PT MDZ4, MDZ7 or MDZ12, e.g. cancer.  
 XX  
 PS Example 8; SEQ ID NO 5259; 103pp; English.  
 XX  
 XX The present invention relates to novel human zinc finger-containing  
 CC proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is  
 CC encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2,  
 CC MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome  
 CC 15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy,  
 CC or in manufacturing a medicament for treating or preventing a disorder  
 CC associated with decreased or increased expression or activity of MDZ3,  
 CC MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic  
 CC acids and proteins are also useful for diagnosing or monitoring a disease  
 CC caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic  
 CC acids can also be used as probes to detect and characterize gross  
 CC alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are  
 CC useful in constructing microarrays for measuring gene expression. The  
 CC proteins are useful as therapeutic agents for gene therapy or as  
 CC vaccines. The present sequence was used to illustrate the invention.

 CC The present invention relates to nucleic acid molecules which modulate  
 CC the synthesis, expression and/or stability of Hepatitis C virus (HCV) or  
 CC Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense  
 CC and enzymatic nucleic acids such as hammerhead ribozymes, DNazymes,  
 CC inozymes, zinzymes, amberyne, and G-cleaver ribozymes. Also disclosed  
 CC are nucleic acid decoy molecules and aptamers that bind to HBV reverse  
 CC transcriptase and/or HBV reverse transcriptase primer sequences, as well  
 CC as oligonucleotides that specifically bind the Enhancer I region of HBV  
 CC DNA. The nucleic acids may be used to modulate the expression of HBV  
 CC genes and HBV viral replication. Also disclosed is a method for screening  
 CC compounds and/or potential therapies directed against HBV, and compounds  
 CC that modulate the expression and/or replication of HCV. The compounds  
 CC methods of the invention are useful for the treatment of degenerative and  
 CC disease states related to HBV and HCV infection, replication and gene  
 CC expression such as cirrhosis, liver failure, and hepatocellular  
 CC carcinoma. The present sequence represents a substrate for one of the HCV  
 CC DNazyme or minus strand DNazyme sequences disclosed in the present  
 CC invention

PS
XX
XX The invention relates to the isolation of 6327 nucleotide sequences,
CC fragments of at least 15 consecutive nucleotides of these nucleotides, a
CC sequence having at least 80% identity, after optimal alignment, with the
CC nucleotides, a sequence that hybridizes under stringent conditions with
CC the nucleotides, or the complement, or corresponding RNA, of the
CC nucleotides. The nucleotides are used as probes or primers for detecting,
CC identifying, quantifying and/or amplifying nucleic acids, as in vitro
CC sense and antisense sequences, of nucleotides involved in tumour
CC suppression or reversion, apoptosis and or viral resistance, to produce
CC recombinant polypeptides, and to prepare transgenic animals, as
CC experimental models. The nucleotides (also vectors containing them and
CC cells containing the vectors), the encoded polypeptides and antibodies
CC (Ab) against the polypeptide are useful for prevention and/or treatment
CC of viral infections or diseases characterized by development of tumours
CC or cell degeneration (e.g. Alzheimer's disease or schizophrenia).
CC Analysis of the expression of the nucleotides can be used for diagnosis
CC and/or prognosis of these diseases. The nucleotides and polypeptides can
CC also be used to screen for their specific interactive molecules,
CC potentially useful for treating diseases associated with abnormal
CC expression of the nucleotides.

XX
PT Novel enzymatic nucleic acid that down-regulates expression of neurite
PT growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or
PT protein kinase PKR genes, for treating cancer and inflammatory disease.
XX
XX
PS Claim 59; SEQ ID NO 2939; 317pp; English.
XX
XX
CC The invention comprises nucleic acids (e.g. antisense oligonucleotides)
CC that down regulate the expression or inhibit the function of a receptor
CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
CC IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
CC invention are useful for treating: cerebrovascular accident, central
CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
CC disease, lupus, multiple sclerosis, transplant/graft rejection,
CC ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic
CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
CC nucleic acids of the invention are also useful for down-regulating the
CC expression of a target gene and as a diagnostic tool to examine genetic
CC drifts and mutations within diseased cells or to detect the presence of a
CC target RNA in a cell. The present RNA sequence represents a human PKR
CC substrate sequence.

 PT Enzymatic nucleic acid molecules which specifically cleave RNA derived  
 PT from hepatitis C virus (HCV), useful for the treatment of HCV infections,  
 PT especially in combination with type I interferon therapy.

XX PS Claim 1; SEQ ID NO 1542; 198pp; English.  
 XX  
 CC The invention relates to an enzymatic nucleic acid molecule which  
 CC specifically cleaves RNA derived from hepatitis C virus (HCV), in which  
 CC the binding arms of the enzymatic nucleic acid molecule comprises  
 CC sequences complementary to any of the defined substrate sequences given  
 CC in the specification. The nucleic acid molecule may be administered for  
 CC the treatment of HCV infections, especially in combination with type I  
 CC interferons. The present sequence represents a HCV DNazyme substrate  
 CC sequence.

XX New DNA encoding protein having juvenile-hormone acid transmethylease  
 PT activity, useful for screening for a compound controlling the expression  
 PT level of juvenile-hormone acid transmethylease DNA.

PS Example 1; SEQ ID NO 11; 118bp; Japanese.

XX The invention relates to a DNA (I) encoding a protein (II) having  
 CC juvenile-hormone acid transmethylease activity selected from the DNA from  
 CC silkworm (Bombyx mori), Drosophila melanogaster, mosquito (Anopheles  
 CC gambiae), Spodoptera litura and Helicoverpa armigera, their encoded  
 CC proteins (S2), DNAs (D2) that hybridize under stringent conditions with  
 CC the nucleic acids or an amino acid sequence (S3) comprising any one of  
 CC (S2) in which one or more amino acids are substituted, deleted, inserted  
 CC and/or added. (I) is useful for screening a compound that controls the  
 CC expression level of (I), and as a controlling agent of molting and  
 CC transformation, reproductive, diapause, blastogenesis, action,  
 CC polymorphism or lifetime of arthropod. (II) is useful for screening a  
 CC compound having binding affinity with respect to (II), which involves

CC contacting test compound with (II), detecting the binding of (II) with  
 CC test compound, and selecting the compound that binds with (II). (II) is  
 CC useful for screening a compound that controls the activity of (II), which  
 CC involves contacting test compound with (II), measuring the activity of  
 CC (II), and selecting the compound that decreases or increases the activity  
 CC of (II), based on comparison of the activity of (II) in absence of test  
 CC compound. (II) is useful for manufacturing activated juvenile hormone.  
 CC This sequence corresponds to a PCR primer used to amplify and isolate the  
 CC transmethylease cDNA from the silkworm Bombyx mori.

XX Novel myosin-like protein-1, useful for treating or preventing disorder

PT associated with decreased expression or activity of human genome-derived  
 PT myosin-like protein-1 such as disorder of heart and/or skeletal muscle  
 XX function.

PS Disclosure; SEQ ID NO 8666; Opp; English.

XX  
 CC The invention relates to a novel polypeptide (I) comprising a sequence  
 CC (S1) of myosin-like protein-1 (hGDMPL-1) having 2588 amino acids fully  
 CC defined in the specification, a fragment of at least 8 amino acids of  
 CC (S1), 95% deviation from (S1) which are conservative substitutions, and  
 CC 65% identity to (S1). A polypeptide of the invention acts as an agonist or  
 CC antagonist of hGDMPL-1, or as an inhibitor of hGDMPL-1 activity. A  
 CC pharmaceutical composition of the invention is useful for treating or  
 CC preventing a disorder associated with decreased expression or activity of  
 CC hGDMPL-1, such as a disorder of heart and/or skeletal muscle function.  
 CC The present sequence represents a 17-mer nucleotide, used in the  
 CC invention for scanning the sequence represented in ACN63103

PT New oligomers contg. modified bases - which form a triplex with G-C  
 PT doublet in a DNA duplex, for treating and diagnosing HIV, hepatitis,  
 PT herpes malignancy and inflammation.

XX  
 PS Claim 12; Page 72; 77pp; English.

XX  
 CC The synthetic oligomer is capable of forming a triplex at physiological  
 CC pH with a purine rich target sequence by coupling into the major groove  
 CC of the duplex. The specific target sequence of this oligomer is the human  
 CC tumour necrosis factor receptor mRNA beginning at nucleotide 2354 contg.  
 CC a purine rich sequence concd. on one strand of the duplex. The oligomer,  
 CC and others like it are useful in diagnosis and therapy of diseases  
 CC characterised by specific DNA duplex targets, e.g. HPV, HER, HIV,  
 CC hepatitis B, herpes, malignant tumours and inflammation. The triple  
 CC helices form under mild conditions thus assays may be carried out without  
 CC subjecting the test specimen to harsh conditions. See also AAQ25452-25501  
 CC and AAQ30226-448. (Updated on 25-MAR-2003 to correct PN field.) (Updated  
 CC on 25-MAR-2003 to correct PD field.)

XX

New anti-proliferative substance comprising a radiolabeled DNA carrier,

PT useful for preventing or treating uncontrolled cellular proliferation

PT e.g. restenosis, cancer or malignant tumors.

XX

Claim 13; SEQ ID NO 9; 28pp; English.

XX

The invention relates to an anti-proliferative substance for preventing

CC uncontrolled cellular proliferation comprising a radiolabelled DNA

CC carrier, where a radioisotope is located internally within the DNA

CC sequence, at 5' end or at 3' end, and the radiolabelled DNA carrier

CC penetrates the cell membrane and is retained intracellularly for a time

CC sufficient for the radio-isotope to effect a dose therapy. The carrier in

CC the anti-proliferative substance is an oligonucleotide, which is linear

CC or a plasmid, which is circular. The plasmid is of viral or bacterial

CC origin. The oligonucleotide is a double- or a single-stranded DNA

CC sequence, which is conjugated with an antibody for cell-specific

CC delivery. The oligonucleotide is also conjugated to a stent surface,

CC cholesterol, oleic acid, linoleic acid, TGPalpa, antibody, TGFbeta,

CC cytokines or growth factors. The anti-proliferative substance is useful

CC for preventing or treating uncontrolled cellular proliferation. The

CC uncontrolled cell proliferation is a restenosis following angioplasty, or

CC cancer or a malignant tumour. The present sequence represents an

CC oligonucleotide carrier used in the invention.

XX

Identifying an individual who has altered risk for developing stenosis

PT comprises detecting single nucleotide polymorphism (SNP), in the

PT individual's nucleic acids.

XX

Claim 19; SEQ ID NO 68096; 146pp; English.

XX

The invention relates to identifying an individual who has altered risk

CC for developing coronary stenosis comprising detecting a single nucleotide

CC polymorphism (SNP) in any one of the 67073 nucleotide sequences (not

CC given in the specification), in the individual's nucleic acids, where the

CC presence of the SNP is correlated with an altered risk for stenosis in

CC the individual. Also included are an isolated nucleic acid molecule

CC (comprising at least 8 contiguous nucleotides where one of the

CC nucleotides is an SNP as cited above, or their complement), an isolated

CC polypeptide comprising an amino acid sequence selected from any of the

CC 696 amino acid sequences (not defined in the specification), an antibody

CC that specifically binds to the polypeptide (or its antigen-binding

CC fragment), an amplified polynucleotide containing the SNP as cited (where

CC the amplified polynucleotide is between about 16 and about 1,000

CC nucleotides in length), an isolated polynucleotide which specifically

CC hybridises to a nucleic acid molecule containing the SNP, a kit for

CC detecting a SNP in a nucleic acid, detecting a SNP in a nucleic acid

CC molecule, detecting a variant polypeptide and identifying an agent useful

CC in therapeutically or prophylactically treating stenosis. The detection

CC step of the method is carried out by a process selected from allele-

CC specific probe hybridisation, allele-specific primer extension, allele-

CC beacon assay, oligonucleotide ligation assay, size analysis, and single-

CC stranded conformation polymorphism. The method is useful for identifying

CC an individual who has altered risk for developing coronary stenosis,

CC which can lead to angina (ischaemic chest pain), myocardial infarction

CC and ultimately sudden cardiac death. The present sequence is an allele

CC specific primer for amplifying a SNP-containing region of a human marker

CC gene associated with stenosis. NOTE: SEQ ID 1-67771 are not shown in the

CC specification but are provided on a CD-R named CL001510CDR which was not

CC supplied with the specification.

New anti-proliferative substance comprising a radiolabeled DNA carrier,

PT useful for preventing or treating uncontrolled cellular proliferation

PT e.g. restenosis, cancer or malignant tumors.

XX

Claim 13; SEQ ID NO 9; 28pp; English.

XX

The invention relates to an anti-proliferative substance for preventing

CC uncontrolled cellular proliferation comprising a radiolabelled DNA

CC carrier, where a radioisotope is located internally within the DNA

CC sequence, at 5' end or at 3' end, and the radiolabelled DNA carrier

CC penetrates the cell membrane and is retained intracellularly for a time

CC sufficient for the radio-isotope to effect a dose therapy. The carrier in

CC the anti-proliferative substance is an oligonucleotide, which is linear

CC or a plasmid, which is circular. The plasmid is of viral or bacterial

CC origin. The oligonucleotide is a double- or a single-stranded DNA

CC sequence, which is conjugated with an antibody for cell-specific

CC delivery. The oligonucleotide is also conjugated to a stent surface,

CC cholesterol, oleic acid, linoleic acid, TGPalpa, antibody, TGFbeta,

CC cytokines or growth factors. The anti-proliferative substance is useful

CC for preventing or treating uncontrolled cellular proliferation. The

CC uncontrolled cell proliferation is a restenosis following angioplasty, or

CC cancer or a malignant tumour. The present sequence represents an

CC oligonucleotide carrier used in the invention.

XX PS Example 3; SEQ ID NO 422; 141pp; English.

CC The invention relates to short interfering nucleic acids (siNA) which

CC downregulate expression of the human tumour necrosis factor (TNF)

CC receptor gene by RNA interference. The siNAs may or may not comprise

CC ribonucleotides and may be double or single stranded. They further

CC comprise sense and antisense regions, or alternatively are assembled from

CC a sense oligonucleotide and an antisense oligonucleotide. Specifically,

CC the siNAs include short interfering RNA (siRNA), double-stranded RNA,

CC micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be

CC unmodified or chemically modified, can contain deoxyribonucleotides, and

CC can be chemically synthesised, expressed from a vector or enzymatically

CC synthesised. The invention also relates to kits for the in vitro or in

CC vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors

CC that express siNA. The siNAs are used to modulate expression of the TNF

CC receptor gene in cells, tissue explants or organisms (e.g., by ex vivo

CC gene therapy), or in grafts and transplants for the treatment of a

CC variety of conditions. The TNF receptor siNAs have antibacterial,

CC immunosuppressive, antirheumatic, antiarthritic, anti-HIV, antipsoriatic

CC and antiinflammatory activities. They may be used for treating septic

CC shock, rheumatoid arthritis, HIV/AIDS, psoriasis, inflammation and

CC autoimmune diseases. The siNAs are also useful for drug screening,

CC diagnosis, therapeutic target identification and validation, genetic

CC engineering, pharmacogenomics, studying gene function, and gene mapping

CC (e.g., of single nucleotide polymorphisms). The present sequence

CC represents the lower strand of a human TNF receptor-targeted double-

XX stranded siNA.

PT length.  
XX Disclosure; Page 88; 97pp; English.  
PS The invention relates to a probe set for gene expression arrays to  
XX provide common equivalent signalling per probe and global amplification  
CC of the set. The probe set has a pool of modified cDNA probes, each probe

CC having a central target specific segment copied from a portion of a  
 CC single mRNA transcript and a universal linker (a WRAP-Probe) located on  
 CC one or both terminal ends. The universal linker has reporter binding  
 CC sites to join common reporters to the probes and primer binding sites to  
 CC copy and amplify the probe. The probes and reporters are useful in  
 CC diagnostic or drug discovery assays for a wide range of biomedical  
 CC samples, including detection of nucleic acids and gene expression  
 CC profiles in human diagnostics, forensics and genomic analysis. The  
 CC methods are useful for amplifying and identifying any unknown DNA  
 CC fragment and also for improving sensitivity with tissue microarrays or  
 CC RNA arrays. The methods improve the quantification of gene expression and  
 CC allow highly improved detection of rare transcripts or very small  
 CC samples. This sequence represents a poly-T primer used in the  
 CC construction of probe sets

XX New isolated RNAs comprising an intron RNA that is released in a cell,  
 PT thus modulating the function of a target gene, useful for treating and  
 PT preventing diseases such as cancer and viral/microbial infections.  
 XX Claim 2; SEQ ID NO 2; 54pp; English.

XX CC The invention relates to isolated RNAs comprising an intron RNA that is  
 CC released in a cell, thus modulating the function of a target gene. Also  
 CC disclosed is a DNA template for the isolated RNA, an expression vector  
 CC comprising the DNA, and a composition comprising one or more agents that  
 CC induce RNA-mediated modulation of the functions of two or more target  
 CC genes in a cell, such as a mammalian cell. The isolated RNAs and  
 CC compositions are useful for modulating the function of a target gene in a  
 CC cell, e.g. to inhibit a cancer-related gene, potential viral gene, and  
 CC microbe-related gene, and thus useful for treating and preventing  
 CC diseases such as cancer and viral/microbial infections. The current  
 CC sequence represents a potential poly-pyrimidine tract of the artificial  
 CC RNA intron.

XX Ribozymes having modified bases and methods for producing them - for use
XX in inhibiting disease related genes.
XX
XX Claim 2; Page 175; 407pp; English.
XX
XX The present sequence represents a preferred target sequence for an
XX enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA at the
XX nucleotide base position indicated in the DE line. Regions of the mRNA
XX that do not form secondary folding structures and that contain potential
XX hammerhead and hairpin ribozyme cleavage sites were identified by
XX computer analysis. Ribozymes directed against these mRNA sequences were
XX designed and synthesised with modifications that improve their nuclease
XX resistance. The ribozymes cleave the ICAM-1 target sequences and thereby
XX inhibit ICAM-1 expression, making them useful for reducing transplant
XX rejection and alleviating symptoms in patients with rheumatoid arthritis,
XX asthma and other inflammatory disorders. (Updated on 25-MAR-2003 to
XX correct PI field.)

XX Peptide nucleic acid probes for detection of ribosomal nucleic acid of  
mycobacteria - allow differentiation between species of tuberculosis  
complex and others and can penetrate cell membranes without pretreatment.

XX Claim 22; Page 67; 106pp; English.

XX This is the nucleotide sequence of the peptide nucleic acid (PNA) probe  
used in the method of the invention, to detect ribosomal nucleic acid of  
mycobacteria. The probes are used, in situ or in vitro, for detection of  
the Mycobacterium tuberculosis complex (MTC), specifically M.  
tuberculosis, and especially in sputum samples, but also in other body  
fluids, biopsy specimens, foods, soil, air and water. Particularly, they  
are used to diagnose, stage or monitor infection, or for identification  
of drug-resistant strains (which generally have mutations in rRNA)

XX New release tag compounds for detecting target molecule(s) - comprising a  
reactive group, a release group and a releasable non-volatile mass label  
detectable by mass spectrometry.

XX Example 3; Page 92; 170pp; English.

XX The sequence is that of an oligonucleotide primer which was produced as  
part of an oligonucleotide peptide conjugate as an example of a release  
tag compound (RTC). These comprise a reactive group, a release group and  
a non-volatile mass label comprising a synthetic polymer or biopolymer  
detectable by mass spectrometry. The RTCs can be used as probes for the  
detection of TWs. They can be used for e.g. identification of gene  
sequences, identification of non-coding nucleotide sequences,  
identification of mutations within a gene or protein sequence, detection  
of metals, detection of toxins, detection of receptors on an organism or  
a cell, characterisation of antibody-antigen interactions, enzyme-  
substrate interactions and characterisation of ligand interactions.  
XX Multiplex applications include multiple pathogen diagnostics, genetic  
polymorphism screening, single nucleotide polymorphism (SNP)  
genotyping, clone and gene mapping, and gene expression analysis. The  
XX RTCs permit the ready detection of releasable mass labels by mass  
spectroscopy. The releasable mass labels permit the multiplexing of tens,  
XX hundreds and perhaps even thousands of different mass labels that can be  
used to uniquely identify each desired target

PI Separation of electrically charged target molecules - by capillary
DR affinity gel electrophoresis using polymer-gel to which receptors for
XX target molecules are bound.
PS Example A1; Page 22; 41pp; English.
XX This sequence represents an oligonucleotide receptor molecule covalently
XX bound to a polyacrylamide gel via a linking group. The invention relates
XX to selective separation of electrically charged target molecules in an
XX analytical mixture. It comprises capillary affinity gel electrophoresis
XX using a capillary tube which is at least partly filled with a polymer
XX gel. Receptors for target molecules are covalently bound to the polymer.
XX An electric field of at least 50 volts/cm is applied. The capillary tube
XX is charged with the analytical mixture. In a first separation stage, the
XX target molecules in the mixture are bound to the receptors and the
XX remaining components are eluted, optionally whilst splitting open. In a
XX second stage, the elution conditions are changed, optionally in stages,
XX so that the affinity of the target molecules for the receptor is
XX eliminated and the target molecules are eluted and detected, optionally
XX whilst splitting open. The process is useful for selective separation
XX and/or determination of charged organic compounds, such as
XX oligonucleotides, peptides or carbohydrates. It may be used, e.g. for
XX isolation of specific proteins and DNA molecules, purification of
XX antibodies, analysis of antisense compounds or screening for enzyme
XX inhibitors. The process achieves higher resolution and selectivity than
XX prior art processes, especially in the case of complex biological
XX analytical mixtures. It has high sensitivity, even with small amounts of
XX samples. The derivatised polymers may be synthesised specifically using
XX standard methods

 XX The present sequence represents the preferred target sequence of an  
 CC enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves  
 CC the Hepatitis C virus (HCV) RNA sequence in the 3' non-core region. The  
 CC HCV sequence was screened for optimal ribozyme target sites using a  
 CC computer folding algorithm and regions of the mRNA which did not form  
 CC secondary folding structures and contained potential ribozyme cleavage  
 CC sites were identified. Ribozymes were synthesised to target these sites  
 CC and their activities optimised by either varying the length of the  
 CC binding arms or by modification to prevent degradation by nucleases. The  
 CC ribozymes of the invention inhibit gene expression and/or viral  
 CC replication, and are used to treat diseases associated with Hepatitis C  
 CC virus (HCV) infection, e.g. cirrhosis, liver failure and hepatocellular  
 CC carcinoma. The ribozymes may be used in combination with interferon to  
 CC treat HCV infection, other infectious diseases, autoimmune diseases, and  
 CC cancer.

XX The present sequence represents the preferred target sequence of an  
 CC enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves  
 CC the Hepatitis C virus (HCV) RNA sequence at the base position given in  
 CC the descriptor line. The HCV sequence was screened for optimal ribozyme  
 CC target sites using a computer folding algorithm and regions of the mRNA  
 CC which did not form secondary folding structures and contained potential  
 CC ribozyme cleavage sites were identified. Ribozymes were synthesised to  
 CC target these sites and their activities optimised by either varying the  
 CC length of the binding arms or by modification to prevent degradation by  
 CC nucleases. The ribozymes of the invention inhibit gene expression and/or  
 CC viral replication, and are used to treat diseases associated with  
 CC Hepatitis C virus (HCV) infection, e.g. cirrhosis, liver failure and  
 CC hepatocellular carcinoma. The ribozymes may be used in combination with  
 CC interferon to treat HCV infection, other infectious diseases, autoimmune  
 CC diseases, and cancer.

 PT pharmaceutical, cosmetic or food compositions to hydrolyze polymanrans.  
 XX PS Disclosure; Page 32; 41pp; French.  
 XX PCR primers AAA46501-02 were used to amplify DNA encoding an endo-beta-  
 CC mannanase enzyme, which is involved in the hydrolysis of polysaccharides  
 CC that consist of molecules of mannan, either simple or branched, linked  
 CC together by beta(1-4) bonds. The mannanase polynucleotide sequence is  
 CC used for in vivo modification of the coffee endo-beta-mannanase gene. It  
 CC is also used to produce transgenic plant cells (especially coffee cells)  
 CC which have modified properties of mannan polysaccharide, and thus altered  
 CC flavour or structure. The enzyme is used for modification, degradation or  
 CC synthesis of mannan polysaccharides in vitro, particularly to treat  
 CC coffee beans to increase the percentage of dry matter extraction, and  
 CC thus reduce the quantity of sediment

XX New polynucleotides encoding a polypeptide having heparanase activity,
PT useful in wound healing and in gene therapy, particularly in treating
PT tumor, inflammation, autoimmunity, neurodegenerative diseases.
XX
XX Disclosure; Page 44; 152pp; English.
XX
XX The present primer was used to reverse transcribe human RNA, from which a
CC cDNA sequence encoding a protein with heparanase catalytic activity was
CC amplified. The heparanase (hpa) polynucleotide is useful in gene therapy,
CC particularly in treating tumour, inflammation or autoimmunity.
CC Particularly, the polynucleotide is useful in modulating the
CC bioavailability of heparin-binding growth factors, cellular responses to
CC heparin-binding growth factors (e.g. bFGF) and cytokines (e.g.
CC interleukin (IL)-8), cell interaction with plasma lipoproteins, cellular
CC susceptibility to certain viral and some bacterial and protozoa
CC infections, or disintegration of neurodegenerative plaques. The
CC polynucleotide is also useful in wound healing (e.g. thermal, chemical or
CC radiation burns), and in the treatment of angiogenesis, restenosis,
CC atherosclerosis, inflammation, neurodegenerative diseases (Gerstmann-
CC Strausler Syndrome or Creutzfeldt-Jakob disease), and some viral,
CC bacterial or protozoa infections

XX
XX The invention provides modified nucleononmers of specified formula and
CC their pharmaceutically acceptable salts. The nucleononmers are used as
CC monomers in oligomers, which are used in pharmaceutical compositions to
CC inhibit expression of nucleic acid molecules including DNA and RNA in
CC cells such as bacterial, fungal, yeast, mammalian, cancer and virally-
CC infected cells. They are used in oligomers for gene regulation, antisense
CC technology, diagnostic applications to detect target sequences in
CC biological samples such as those containing pathogenic bacteria, fungi
CC and viruses, oncogenes, growth hormones and enzymes, to target genes or
CC encoded RNAs that encode enzymes, hormones, serum proteins, adhesion
CC molecules, receptor molecules, cytokines, oncogenes, growth factors and
CC interleukins associated with pathological conditions such as inflammatory
CC conditions, cardiovascular disorders, immune reactions, cancer, viral
CC infections and bacterial infections (see AAA07786 for details of other
CC uses for which the oligomers are suitable for). Oligomers comprising the
CC nucleononmers exhibit increased duplex DNA stability when hybridizing to
CC target nucleic acid sequences, are physiologically stable, non-toxic and
CC able to penetrate into cells while maintaining stringent base pair
CC fidelity for target DNA sequences. The oligomers demonstrate significant
CC single- or double-stranded target nucleic acid binding activity to form
CC duplexes, triplexes or other forms of stable association. Sequences

XX The invention provides modified nucleomomers of specified formula and
CC their pharmaceutically acceptable salts. The nucleomomers are used as
CC monomers in oligomers, which are used in pharmaceutical compositions to
CC inhibit expression of nucleic acid molecules including DNA and RNA in
CC cells such as bacterial, fungal, yeast, mammalian, cancer and virally-
CC infected cells. They are used in oligomers for gene regulation, antisense
CC technology, diagnostic applications to detect target sequences in
CC biological samples such as those containing pathogenic bacteria, fungi
CC and viruses, oncogenes, growth hormones and enzymes, to target genes or
CC encoded RNAs that encode enzymes, hormones, oncogenes, growth factors or
CC molecules, receptor molecules, cytokines, serum proteins, adhesion
CC interlukins associated with pathological conditions such as inflammatory
CC conditions, cardiovascular disorders, immune reactions, cancer, viral
CC infections and bacterial infections (see AAA07786 for details of other
CC uses for which the oligomers are suitable for). Oligomers comprising the
CC nucleomomers exhibit increased duplex DNA stability when hybridizing to
CC target nucleic acid sequences, are physiologically stable, non-toxic and
CC able to penetrate into cells while maintaining stringent base pair
CC fidelity for target DNA sequences. The oligomers demonstrate significant
CC single- or double-stranded target nucleic acid binding activity to form
CC duplexes, triplexes or other forms of stable association. Sequences
CC AAA07788-803 represent oligonucleotides forming a third strand along with
CC the duplex sequences

 PS  
 XX The invention provides modified nucleomoners of specified formula and  
 XX their pharmaceutically acceptable salts. The nucleomoners are used as  
 CC monomers in oligomers, which are used in pharmaceutical compositions to  
 CC inhibit expression of nucleic acid molecules including DNA and RNA in  
 CC cells such as bacterial, fungal, yeast, mammalian, cancer and virally-  
 CC infected cells. They are used in oligomers for gene regulation, antisense  
 CC technology, diagnostic applications to detect target sequences in  
 CC biological samples such as those containing pathogenic bacteria, fungi  
 CC and viruses, oncogenes, growth hormones and enzymes, to target genes or  
 CC encoded RNAs that encode enzymes, hormones, serum proteins, adhesion  
 CC molecules, receptor molecules, cytokines, oncogenes, growth factors and  
 CC interleukins associated with pathological conditions such as inflammatory  
 CC conditions, cardiovascular disorders, immune reactions, cancer, viral  
 CC infections and bacterial infections (see AAA07786 for details of other  
 CC uses for which the oligomers are suitable for). Oligomers comprising the  
 CC nucleomoners exhibit increased duplex DNA stability when hybridizing to  
 CC target nucleic acid sequences, are physiologically stable, non-toxic and  
 CC able to penetrate into cells while maintaining stringent base pair  
 CC fidelity for target DNA sequences. The oligomers demonstrate significant  
 CC single- or double-stranded target nucleic acid binding activity to form  
 CC duplexes, triplexes or other forms of stable association. Sequences  
 CC AAA07788-803 represent oligonucleotides forming a third strand along with  
 CC the duplex sequences

PT New conformationally restricted 3',5'-bridged nucleosides and  
 PT oligonucleotides useful as antisense therapeutics or as gene-specific  
 PT diagnostics.

XX Example 20; Col 16; 10pp; English.

XX The present sequence is an oligonucleotide containing 3'-C-amino-5'(S)-  
 CC C,3'-N-ethanothymidine, a bicyclic-sugar nucleoside. All nucleotides in  
 CC the sequence were incorporated by phosphoramidite chemistry using a DNA  
 CC synthesizer. Bicyclic sugar nucleosides are conformationally restricted  
 CC 3',5'-bridged nucleosides which can be used as building blocks for  
 CC oligonucleotides. Oligonucleotides can be produced that have certain,  
 CC desired, geometrical shapes and entropy advantages. They may have  
 CC superior hybridisation to DNA and RNA, and excellent biological  
 CC stability. The conformationally-modified oligonucleotides may be useful  
 CC as antisense inhibitors of gene expression or as gene probes, and may  
 CC therefore be used in antisense therapeutics or gene-specific diagnostics

XX
XX New conformationally restricted 3',5'-bridged nucleosides and
XX oligonucleotides useful as antisense therapeutics or as gene-specific
XX diagnostics.
XX
XX Example 20; Col 15; 10pp; English.
XX
XX The present sequence is an oligonucleotide containing 3'-C-amino-5'(R)-
XX C,3'-N-ethanothymidine, a bicyclic-sugar nucleoside. All nucleotides in
XX the sequence were incorporated by phosphoramidite chemistry using a DNA
XX synthesiser. Bicyclic sugar nucleosides are conformationally restricted
XX 3',5'-bridged nucleosides which can be used as building blocks for
XX oligonucleotides. Oligonucleotides can be produced that have certain,
XX desired, geometrical shapes and entropy advantages. They may have
XX superior hybridisation to DNA and RNA, and excellent biological
XX stability. The conformationally-modified oligonucleotides may be useful
XX as antisense inhibitors of gene expression or as gene probes, and may
XX therefore be used in antisense therapeutics or gene-specific diagnostics

XX
XX New hybridization probe for specific triplex formation with large double
XX helices, useful e.g. for site-specific diagnostic cleavage, contains
XX attached functional residue.
XX
XX Example 1; Fig 3B; 20pp; English.
XX
XX This invention relates to hybridisation probes which target a specific
XX sequence within a large double-helical nucleic acid. The probe is
XX complementary to the target sequence and contains at least one nucleotide
XX with an attached molecule that is able to cleave double-helical DNA e.g.
XX EDTA-Fe(II) (ethylenediaminetetraacetic acid-iron complex). The probes
XX where the attached molecule is a label or compound that alters gene
XX expression, are used for specific detection and/or cleavage of double-
XX helical DNA, e.g. for diagnosis, for treatment of disease (particularly
XX caused by viruses, genetic defects or oncogenes), for chromosomal
XX analysis, and for the isolation and mapping of genes. The present
XX sequence represents probe of the invention used in an example
XX illustrating how the probe binds to and cleaves double stranded DNA

XX
XX Conjugate of oligonucleotide, minor groove binder and latent fluorophore,
XX useful for detecting specific nucleic acids, e.g. for single-nucleotide
XX mismatch discrimination.
XX
XX Disclosure; Page 58; 105pp; English.
XX
XX The present sequence is that of the oligonucleotide (ODN) component of an
XX ODN-MGB (minor groove binder)-LF (latent fluorophore) conjugate of the
XX invention. MGBs bind in a non-intercalating manner to the minor groove of
XX non-single-stranded DNA, RNA or their hybrids, while a LF binds similarly
XX but in an intercalating manner, or lies in the minor groove, or is
XX oriented in some other way to the DNA molecule by MGB, such that it
XX becomes fluorescent for its fluorescent properties change detectably).
XX The conjugates are used as hybridisation probes and amplification primers
XX for fluorescent detection of specifically hybridising sequences, for
XX analysis or diagnosis, especially (real-time) PCR, for single-nucleotide
XX mismatch discrimination, target or signal amplification, array-based
XX triplex formation. Many different targets can be detected a single
XX reaction vessel. The present ODN-MGB-LF conjugate was used to demonstrate
XX hybridisation-triggered fluorescence. Upon hybridisation to the
XX complementary target sequence there was an increase in fluorescence
XX yield, measured as the ratio of the fluorescence emitted by the hybrid
XX between the ODN-MGB-LF conjugate and its target sequence to the
XX fluorescence emitted by unhybridised (i.e. single-stranded) ODN-MGB-LF,

XX Intermediate for oligonucleotide synthesis comprises partially hydrolysed  
PT cross-linked vinyl acetate copolymer loaded with nucleotide derivative.  
XX  
XX  
PS Example 2; Page 5; 8pp; German.  
XX  
CC This invention describes a novel chemical product comprising a partially  
CC hydrolysed cross-linked vinyl acetate copolymer carrier material loaded  
CC with nucleotide derivative(s). The product is an intermediate for the  
CC large (gram) scale solid phase synthesis of modified oligonucleotides  
CC useful e.g. as clinical diagnostics and therapeutics, e.g. for the  
CC treatment of AIDS and cancers. The presence of the partially hydrolysed  
CC copolymer facilitates the synthesis of larger amounts of oligonucleotides  
CC compared with the use of Merckogel (RTM; macroporous polyvinyl acetate)  
CC described in Nucleic Acid Res. Sympos. Ser. 31, p. 153, 1994.  
CC Oligonucleotides are obtained in very good quality and high yields. Also,  
CC the nucleosides do not display the reduced activity seen in some prior  
CC art procedures, less carrier material, reagents and solvent are required.  
CC Further, the carrier material is biodegradable and thus does not present  
CC disposal problems. It also swells uniformly in a range of solvents, which  
CC obviates expansion or contraction during use or solvent exchange.  
CC AAH20510-AAH20513 represent oligonucleotides containing modified  
CC deoxynucleotides which are used to illustrate the method of the invention

XX  
PS Example 26; Page 40; 54pp; German.  
XX  
CC This invention describes novel polyamide-oligonucleotide derivatives (I)  
CC and their physiologically acceptable salts of formula F(DNA)-Li<sub>q</sub>(DNA-  
CC Li)<sub>r</sub>(DNA-Li)<sub>s</sub>(PNA)<sub>t</sub> XP, where q, r, s, t = 0 or 1, with the sum of  
CC two or more adjacent letters at least 2; x = 1-20; DNA = nucleic acid  
CC (such as DNA or RNA or their known derivatives); Li = covalent linkage  
CC between DNA and PNA, i.e. a bond or a residue containing at least one  
CC atom of carbon, nitrogen, oxygen or sulfur; PNA = polyamide structure  
CC containing at least one nucleobase different from thymine, and F, P =  
CC end groups and/or are connected through a covalent bond. The products of  
CC the invention have anticancer, antiproliferative, antiviral, hepatotropic  
CC and vasotropic activity and can be used for the inhibition of gene  
CC expression by antisense, ribozyme, sense, or triple-helix methods, or by  
CC binding to proteins (aptamers). (I) are used for treating diseases caused  
CC by viruses (human immune deficiency, herpes simplex, influenza, vesicular  
CC stomatitis, hepatitis B or papilloma), or mediated by integrins or cell-  
CC cell adhesion reactions, for treating cancer, or for inhibiting  
CC restenosis, particularly as antisense reagents. They are also useful in  
CC heterogeneous or homogeneous assays, as primers or probes, particularly  
CC where the target is amplified before being detected by hybridization, for  
CC diagnosis of genetic, malignant or pathogen-related diseases. (I) retain  
CC the increased affinity for complementary strands and better stability in  
CC serum, associated with conventional peptide nucleic acids (PNA), but lack  
CC the disadvantages, i.e. have improved cellular uptake, do not aggregate  
CC in aqueous solution, and have reduced affinity for purification  
CC materials, reduced cytotoxicity, better sequence specificity. They are  
CC more active than either DNA or PNA oligomers. When used as probes, (I)  
CC show different responses to base-pair mismatches in the DNA and PNA  
CC segments, allowing better discrimination between pathogenic and non-  
CC pathogenic conditions such as the transition from proto-oncogene to  
CC oncogene, also, when used as primers, with the PNA segment at the 5'-end,  
CC they produce amplicons resistant to 5'-exonuclease, allowing this enzyme  
CC to be used to eliminate RNA or DNA primers. The DNA component allows  
CC additional reactions not possible with PNA alone, e.g. 3'-tailing and (I)  
CC may be incorporated into a gene. AAH49208-AAH49264 represent  
CC oligonucleotides used to illustrate the method of the invention

 PT Oligonucleotides analogs useful in detection, separation and purification

PT of nucleic acid molecules, comprise monomers, dimers and oligomers.  
 XX  
 PS Example 20; Page 123; 197pp; English.  
 XX  
 CC This invention relates to oligonucleotide analogues comprising a protein  
 CC nucleic acid molecule (PNA) monomer. They are used in the detection and  
 CC separation of nucleic acid molecules and as probes, primers, linkers,  
 CC adapters and antisense agents on solid supports. Modifications enhance  
 CC their use as capture and detection probes e.g. by the incorporation of  
 CC biotin, digoxigenin, radioisotopes, fluorescent labels such as  
 CC fluorescein and reporter molecules such as alkaline phosphatase. They are  
 CC also used for enhancing or inhibiting the activity of an enzyme or  
 CC cellular activity. The compounds are stable to nucleases and proteases,  
 CC have high affinity, binding specificity and solubility. The polyamide  
 CC backbone of PNAs is resistant to both nucleases and proteases. PNAs bind  
 CC nucleic acid molecules with greater affinity than DNA or RNA  
 CC concentration. The compounds are relatively simple to synthesize and are  
 CC used in a wide variety of applications. This sequence represents a DNA  
 CC oligomer which is used to represent the effect of single base mismatches  
 CC on oligonucleotides

 PT Detecting mutations in nucleic acid, useful for diagnosis and  
 PT characterization of tumors, by amplification, in vitro transcription and  
 PT translation, then protein detection.  
 XX

```
PS Claim 11; Fig 5; 62pp; German.
CC The present invention relates to a method of detecting mutations in a
CC nucleic acid by amplifying the nucleic acid to produce a double-stranded
CC amplicon, in vitro transcription and translation of this amplicon, and
CC detection of the translated protein. The primers used for amplification
CC are designed to produce an amplicon that is translatable and allows
CC differentiation between translation products of wild-type and mutated
CC nucleic acids. The method is used to detect mutations in tumour
CC suppressor genes, for (early) diagnosis, monitoring and characterisation
CC of tumours (especially of bladder and intestines) and in the germ line
CC (using nucleic acids from embryos or blood cells). A new multi-tag vector
CC is used to detect or verify the reading frame of a nucleic acid cloned in
CC it, and to determine the suitability of detectable peptides for analysis
CC and/or purification of a recombinant protein, expressed from a sequence
CC cloned in the vector. The present sequence encodes a tag peptide and was
CC used in the invention

XX New human pre-adipose cell line capable of differentiating to adipose
PT cells, useful in developing drug, food ingredients, and supplements
PT against obesity, diabetes and cardiovascular diseases.
XX
XX Example 5; Page 10; 30pp; English.
XX
XX The present invention relates to new human pre-adipose cell lines capable
CC to differentiate to white adipose cells, exhibiting essentially the same
CC cellular properties of normal white adipose cells. The human pre-adipose
CC cell lines are useful for the identification of substances controlling
CC the regulation of lipid uptake and release by human white adipocytes, and
CC substances controlling the differentiation of preadipocytes into mature
CC adipocytes. They are useful for screening compounds capable to regulate
CC the secretion of any metabolites or hormones from human white adipocytes.
CC Sequences of the invention are useful for developing drugs, food
CC ingredients and supplements against obesity, diabetes and cardio-
CC vascular diseases. The present DNA sequence is a reverse transcription
```

CC (RT)-PCR primer which is used for the expression of adipocytes in  
 CC differentiated immortalised human preadipose cells. This primer is used  
 CC in the exemplification of the invention

PT Derivatized antisense oligoribonucleotide useful to inhibit e.g. viral  
 PT reverse transcriptase comprises at the 2'-O position of the  
 PT oligoribonucleotide, a hydrophobic carrier reagent containing a poly  
 PT substituted phenyl compound.

XX Example 3; Col 24; 56pp; English.

XX The invention relates to derivatised antisense oligoribonucleotides with  
 CC enhanced membrane permeability and stability. The derivatised antisense  
 CC oligoribonucleotide complementary to a sequence of nucleotides found in a  
 CC virus or a cell is useful for inhibiting e.g., viral reverse  
 CC transcriptase. Derivatized antisense oligoribonucleotide is conjugated at  
 CC the 2'-O position with a hydrophobic carrier reagent containing a poly  
 CC substituted phenyl compound. The derivatised oligoribonucleotides are  
 CC used to decrease the expression of oncogenes and thereby decrease the  
 CC expression of cancer cells which rely upon oncogene expression for their  
 CC phenotypic and pathological properties. The oligoribonucleotides are also  
 CC used for increasing the effectiveness of antisense oligonucleotide  
 CC targeted to a gene associated with a disease or a condition in an  
 CC animal. To alter gene transcription and/or translation for any gene or  
 CC gene segment responsible for expression, to inhibit viral reverse  
 CC transcriptase, to inhibit the expression of leukaemia virus, hepatitis

CC virus, oncogenes and human immunodeficiency virus. The present sequence  
 CC is retroviral reverse transcriptase inhibitor DNP-poly [A] RNA fragment  
 CC which is used in the treatment of moloney murine leukaemia virus (MuLV)  
 CC in mammals. (Updated on 07-AUG-2003 to correct OS field.) (Updated on 29-  
 CC AUG-2003 to standardise OS field)

XX New vectors comprising operably linked DNA fragments having an origin of  
 PT replication, a selectable marker and a chimeric DNA construct, useful for  
 PT silencing target nucleic acids and for producing large amounts of double-  
 PT stranded RNA.

PS Claim 14; Page 74; 104pp; English.

XX The present invention describes a vector (I) comprising operably linked  
 CC DNA fragments having: (a) origin of replication allowing replication in a  
 CC recipient cell, preferably in bacteria such as Escherichia coli; (b)  
 CC selectable marker region capable of being expressed in the recipient cell  
 CC ; and (c) a chimeric DNA construct comprising: (i) promoter or promoter  
 CC region capable of being recognized by RNA polymerases of a eukaryotic  
 CC cell or by prokaryotic RNA polymerase; (ii) first, second, third and  
 CC fourth recombination sites; (iii) 3' transcription terminating and  
 CC polyadenylation region functional in the eukaryotic cell. The first and  
 CC fourth recombination sites, or the second and third recombination sites  
 CC are capable of reacting with a same recombination site, and preferably  
 CC are identical. The first and second recombination sites, or the third and  
 CC fourth recombination sites, do not recombine with each other or with a  
 CC same recombination site. The vector is useful for producing large amounts  
 CC of double-stranded RNA which can be used for silencing target nucleic  
 CC acid sequences. The vectors can also be used to convert a DNA fragment  
 CC into an inverted repeat structure. Plants transformed with a vector from  
 CC the present invention can be used in a conventional breeding scheme to  
 CC produce more plants with the same characteristics or to introduce a

```

PT New ribozymes targeting RNA derived from hepatitis C virus inhibit viral
PT replication and are useful to treat hepatitis C virus infections and
PT cirrhosis, liver failure or hepatocellular carcinoma.
XX
PS Claim 1; Page 21; 80pp; English.
XX
CC The present invention relates to enzymatic nucleic acids which
CC specifically cleave RNA derived from Hepatitis C virus (HCV). The
CC enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin
CC (HP) motif where the binding arms comprise sequences complementary to one
CC of the substrate sequences defined in the specification. The HCV
CC ribozymes are useful for modulating the expression and/or replication of
CC hepatocellular carcinoma. The HCV ribozymes are also useful for treating
CC a condition associated with HCV infection in conjunction with one or more
CC other drug therapies, particularly type I interferon, especially
CC interferon alpha, beta or gamma or consensus interferon. The present
CC sequence represents a substrate for a HCV hammerhead (HH) ribozyme. Note:
CC Some of the sequence data for this patent did not form part of the
CC printed specification. The complete sequence data for this patent was
CC obtained in electronic format directly from the USPTO web site at

PT A triple-helix comprising a double helical nucleic acid (DHNA) and an  
PT oligonucleotide which binds in parallel and antiparallel orientation,  
PT respectively, for targeting sequences on alternate strands of DHNA to  
XX control gene expression.  
PS Example 1; Fig 3B; 108pp; English.  
XX  
CC The present invention relates to methods and oligonucleotides for forming  
CC a triple-helix comprising a double helical nucleic acid comprising first  
CC and second substantially complementary strands, and an oligonucleotide  
CC bound to a purine-rich target sequence within the double helical nucleic  
CC acid, where the oligonucleotide binds in a parallel and antiparallel  
CC orientation, respectively, to target sequences on alternate strands of  
CC the double helical nucleic acid. The method has therapeutic applications,  
CC where gene expression is controlled by selective triple-helix formation  
CC within expression regulatory sequences of a target gene. The  
CC oligonucleotides can be used to form triple-helices, and are useful to  
CC detect the presence or absence of specific sequences within genomic DNA  
CC for diagnostic and therapeutic purposes. The oligonucleotides can be  
CC selected to specifically bind to pathogenic double-stranded DNA including  
CC replication or virulence, reducing their pathogenicity. Alternatively,  
CC the oligonucleotide can be chosen to target a unique sequence of the  
CC pathogen which is not found in the genome of pathogen's host. The  
CC oligonucleotides can be used in cancer treatment by way of triple-helix  
CC suppression of specific oncogenes including those of endogenous or viral  
CC origin. Such therapeutic oligonucleotides are capable of forming triple-  
CC helices with such sequences in cancerous cells containing the activated  
CC oncogene, so preferentially killing or repressing the cancer causing  
CC cell. The present sequence represents an oligonucleotide used in the  
XX methods of the present invention

PT nucleic acid library.

XX PS Disclosure; Fig 5; 83pp; English.

XX CC The present sequence is that of the 5' end of a cDNA clone isolated from  
CC a cDNA library e.g. a mosquito antenna library. A clone was isolated  
CC using a method designed to rapidly array and normalize a complex cDNA  
CC library obtained from a target species. Clones are arrayed into multi-  
CC well plates. Each well contains 16 oligonucleotides (see ABV74137) with a  
CC 5' polylinker, a poly-T run capable of binding cDNAs by their poly-A tail  
CC and a unique 3' sequence, which allows an anchored oligonucleotide in  
CC each well to selectively hybridise only to those cDNA clones with a  
CC complementary 5' end. The unique 3' key sequences are designed to give a  
CC comprehensive level of degeneracy since they are diverse and numerous  
CC enough to ensure that every possible cDNA sequence can be bound by an  
CC individual, specific oligonucleotide in a single well. The cDNA library  
CC is heated to denature the clones into single stranded DNA, and an aliquot  
CC is added to every well. The anchored oligonucleotide serves as the 3'  
CC primer in PCR, and the common 5' region present in every cDNA clone  
CC serves as the 5' priming site. Denaturing and washing leave anchored cDNA  
CC in each well. The library is now arrayed and normalised. The method was  
CC used to identify and isolate clones encoding G-protein coupled receptors,  
CC especially odourant receptors, and active effectors involved in the  
CC olfactory pathway of invertebrates and vertebrates, e.g. odourant binding  
CC proteins, or other olfactory or neuronal proteins. The identified  
CC receptors and proteins are useful for identifying compounds that reduce a  
CC target animal's sensitivity to odours, for manufacturing compounds or  
CC devices that mask odours, or trapping invertebrates with odourants.  
CC Semiochemicals (e.g. aromatics or pheromone mimetics) can be developed  
CC with desirable effects on specific species, for the development of pest  
CC monitoring systems or non-toxic, species-specific pesticide alternatives,  
CC for controlling insect feeding and breeding behaviour, detecting the  
CC presence of small air-borne molecules, etc

 PT New oligonucleotide deprotection reagent useful for deprotecting  
 PT oligonucleotide comprises an active methylene compound and an amine  
 PT reagent.  
 XX  
 PS Example 2; Page 25; 46pp; English.

CC The present invention provides a method for deprotection of an  
 CC oligonucleotide. This involves reacting a protected oligonucleotide,  
 CC which is preferably covalently attached to a solid support through a  
 CC linkage, with a deprotection reagent comprising an active methylene  
 CC compound and an amine reagent. The process and reagent minimise side-  
 CC reactions leading to certain impurities that contaminate synthetic  
 CC oligonucleotides. The present sequence is a T15 phosphoramidite  
 CC oligonucleotide having a quencher moiety (Q) and minor groove binder  
 CC (CDPI3) at the 3' end, which was synthesised in an example of the  
 CC invention. This protected oligonucleotide was treated either with 15%  
 CC ethanolic ammonia or with 3% diethylmalonate (DEM) dissolved in 15%  
 CC ethanolic ammonia for 2 hours at 55 degrees C. HPLC analysis showed that

CC deprotection without DEM yielded a complex mixture of products containing  
 CC only 26.5% of the desired product. When DEM was used, 76.8% of the  
 CC desired product was obtained

XX  
 PT Hairpin sensor useful for detecting a target nucleotide sequence in a  
 PT sample, comprises a hairpin loop assembly including a complementary probe  
 PT and a quenchable fluorescing agent.  
 XX  
 PS Example 2; Page 11; 16pp; English.

CC The invention discloses a hairpin sensor comprising a hairpin loop  
 CC assembly including a complementary probe positioned between a first  
 CC inverse repeat arm and a second inverse repeat arm, and a quenchable  
 CC fluorescing agent joined, directly or indirectly, to the end of the  
 CC second inverse repeat arm of the hairpin loop assembly opposite the  
 CC complementary probe. Also claimed is a microarray comprising the hairpin  
 CC sensor, where the end of the first inverse repeat arm opposite the  
 CC complementary probe is bound, directly or indirectly, to a support, a kit  
 CC for detecting a target nucleotide sequence in a sample comprising the  
 CC hairpin sensor, and a support, and a hairpin sensor system, in which the  
 CC particle is conductive or semi-conductive, including at least one of the  
 CC above hairpin sensor assemblies. The hairpin sensor further comprises a  
 CC functional group joined to the end of the first inverse repeat arm

CC opposite the complementary probe, or first spacer opposite the first  
 CC inverse repeat arm, the functional group selected from amino, carboxyl,  
 CC thiol and hydroxyl. Further, the sensor comprises a ligand positioned  
 CC between the second inverse repeat arm and the quenchable fluorescing  
 CC agent, where the ligand is selected from mercapto, hydroxyl, amino,  
 CC nitrile and carboxyl, carboxylic acid, organic acid and amino acid. The  
 CC second spacer is positioned between the second inverse repeat arm and the  
 CC quenchable fluorescing agent which comprises a semiconductor nanocrystal  
 CC or rhodamine B-labelled dye. Within the microarray the support is capable  
 CC of accepting a charge. At least one hairpin sensor comprises two or more  
 CC hairpin sensors. The two or more hairpin sensors include complementary  
 CC probes that are the same or different and respective quenchable  
 CC fluorescing agents that are the same or different. The two or more  
 CC hairpin sensors are arranged in a spatially-defined pattern. The sensor  
 CC and system are useful for detecting a target nucleotide sequence in a  
 CC sample. Further, the method involves identifying the target nucleotide  
 CC sequence by the location of the complementary probe to which the target  
 CC nucleotide sequence binds. The two or more hairpin sensors include  
 CC complementary probes or quenchable fluorescing agents, that are  
 CC different. The sequence presented is the hairpin oligonucleotide target  
 CC sequence, #1, used in an example of the invention.

 PT Method of inhibiting expression of genes or RNA transcripts, useful for  
 PT therapy and determining effects of genes, by administering oligomers  
 PT containing hydroxyproline nucleic acid.  
 XX  
 PS Example 20; Page 234; 240pp; English.  
 XX  
 CC The invention relates to a novel method of inhibiting the expression of  
 CC one or more genes or RNA transcripts by administering at least one

CC oligonucleotide analogue that includes at least one hydroxyproline  
 CC nucleic acid (HypNA) monomer to a cell or organism or their extracts. The  
 CC oligonucleotides of the invention may be used to monitor properties  
 CC including gene expression, respiration, secretion, signalling, ion-  
 CC channel activity, cell motility, developmental phenotype and tumour  
 CC regression. Furthermore, they may be utilised to determine the effects of  
 CC particular genes, as antisense or homologous recombination constructs  
 CC e.g. for creating animal models of disease and finally, for increasing  
 CC the activity of some enzymes, such as polymerases. The current sequence  
 CC is that of the single-base mismatch oligonucleotide SEQ ID 10 DNA of the  
 CC invention. This sequence may also comprise a peptide nucleic acid (PNA),  
 CC a phosphono-PNA (pPNA) or a HypNA.

 PT Annealing control primer to improve annealing specificity in nucleic acid  
 PT amplification, has region complementary to target, arbitrary nucleotide  
 PT sequence, regulator with universal base/non-discriminatory base analog.

XX  
 PS Example 2; SEQ ID NO 54; 190pp; English.  
 XX  
 CC The present invention describes an annealing control primer (ACP) (I) for  
 CC improving the annealing specificity in nucleic acid amplification. (I)  
 CC has a 3'-end portion with a nucleotide sequence complementary to a site  
 CC on a template nucleic acid for hybridisation, a 5'-end portion having a  
 CC pre-selected arbitrary nucleotide sequence, and a regulator portion  
 CC between the 3' and 5'-end portions, comprising a universal or non-  
 CC discriminatory base analogue, where the regulator portion is capable of  
 CC regulating an annealing portion of the primer in association with  
 CC annealing temperature. (I) is useful for improving annealing specificity  
 CC in nucleic acid amplification. (I) is useful for amplifying a nucleic  
 CC acid sequence from a DNA or a mixture of nucleic acids, for selectively  
 CC amplifying a target nucleic acid sequence from a DNA, and for selectively

CC amplifying a target nucleic acid sequence from a mRNA, by reverse  
CC transcribing the mRNA and performing an amplification reaction using (I).  
CC (I) is also useful for detecting DNA complementary to differentially  
CC expressed mRNA in two or more nucleic acid samples, by reverse  
CC transcribing the mRNA and performing an amplification reaction using (I).  
CC (I) is also useful for rapidly amplifying a target cDNA fragment  
CC comprising a cDNA region corresponding to the 3'-end or 5'-end region of  
CC an mRNA, for amplifying a population of full-length double-stranded cDNAs  
CC complementary to mRNAs, and amplifying 5'-enriched double-stranded cDNAs  
CC complementary to mRNA. (I) is also useful for amplifying more than one  
CC target nucleotide sequence simultaneously using more than one pair of  
CC primers in the same reaction, where the primers are derived from (I), for  
CC producing a DNA fingerprint of genomic DNA (gDNA), for producing a RNA  
CC fingerprint of an mRNA sample, identifying conserved homology segments in  
CC a multigene family from an mRNA sample, and for identifying conserved  
CC homology segments in a multigene family from gDNA. (I) is also useful for  
CC identifying a nucleotide variation in a target nucleic acid, and for  
CC mutagenesis in a target nucleic acid. The present sequence represents a  
CC primer which is used in the exemplification of the present invention.

XX Recombinant jungle red fowl (Gallus gallus) heparanase protein, useful  
PT for treating cancers, microbial infections and aiding wound healing.

XX Example; Page 13; Opp; English.

XX The present invention relates to novel jungle red fowl heparanase protein  
CC and polynucleotides encoding such proteins. Heparanase sequences can be  
CC used to develop treatments for various diseases, to develop diagnostic  
CC assays for these diseases and to provide new tools for basic and directed  
CC research especially in the fields of medicine and biology. They can be  
CC used to develop new drugs to inhibit tumour cell metastasis, inflammation  
CC and autoimmunity. Recombinant heparanase offers a potential treatment for  
CC wound healing, angiogenesis, restenosis, atherosclerosis, inflammation,  
CC neurodegenerative diseases (e.g. Genstmann-Straussler Syndrome, Scrapie,  
CC Creutzfeldt-Jakob disease and Alzheimer's disease) and certain viral and  
CC some bacterial and protozoa infections. Recombinant heparanase can also  
CC be used to neutralise plasma heparin, as a potential replacement of  
CC protamine. Sequences of the invention are used in protein therapy. The  
CC present sequence is chicken heparanase DNA specific PCR primer used in  
CC the exemplification of the invention

PT Repairing mutated exons in pre-mRNA, useful e.g. for treatment of tumors,  
by expressing, in a cell, repair DNA that replaces mutated exon by trans-  
splicing.  
XX  
PS Disclosure; Fig R; 114pp; German.  
XX  
CC This invention describes a novel method of repairing a mutated exon (mE)  
in the pre-mRNA of a mammalian cell. The method comprises introducing  
into the cell a DNA (I) that encodes repair RNA (II) in the form of a pre  
-mRNA (III) comprises a non-mutated exon (mME) with at least one flanking  
outtron so that mE is exchanged for mME, via RNA trans-splicing, using  
splice components naturally present in the cell. The invention also  
discloses DNA, encoding trans-splicing RNA that comprises an origin of  
replication, an RNA polymerase-II promoter and a 3'-terminal signal for  
polyadenylation of pre-mRNA, selective killing of tumour cells in a cell  
population, identifying potential trans-splicing sites in cellular pre-  
mRNA and subsequent identification of natural, cellular trans-spliced RNA  
and identifying trans-splicing sites in cellular mRNA. The nucleic acid  
of the invention produces a repair RNA containing a 5'-outtron and/or 3'-  
outtron with at least 10 nucleotides (nt). Each outtron has at least one  
antisense sequence that pairs, in antisense, over a length of at least 18  
bases to mE and/or to an intron region that flanks mE. Especially the  
antisense part of the 5'-outtron pairs to the intronic polypyrimidine  
sequence of a 3'-splice site in mE, while that of the 3'-outtron pairs to  
the intronic sequence of a 5'-splice site. Especially the 5'-outtron  
comprises a branch-A site, a polypyrimidine stretch and an AG  
dinucleotide at the border of the repair exon, while the 3'-outtron  
includes a GU dinucleotide at the border of this exon. The repair exon  
comprises, apart from the wild-type sequence, a 3-mer, 3'-sequence as  
exonic splice site, provided that the exon follows an outtron, optionally  
also an exonic splice enhancer site which does not introduce  
additional/alters amino acids. Alternatively, the nucleic acid encodes a  
truncated cell-death pre-mRNA that includes a frame shift sequence (up to  
nt) at the 5'-end, also a recognition site for a cellular protease; it  
then has a 5'-outtron that hybridises to specific tumour cell pre-mRNA or  
it is a probe pre-mRNA of 150-250 nt, if no protein-encoding sequences  
are present in the exon, or several hundred nt if such sequences are  
present. It also includes a single 5'- or 3'-splice site and,  
accordingly, an exon or outtron, where the outtron includes a sequence of

CC 12-18 uracils and an 8-12-mer recognition/cleavage site for a restriction  
enzyme. The trans-spliced RNA is amplified by cDNA-PCR (polymerase chain  
reaction), and the products sequenced in the region that represents the  
unknown cellular RNA. Further PCR analysis is performed using primers  
that hybridise to two, predetermined, previously sequenced, exonic  
fragments of the two trans-spliced RNAs. Natural cellular trans-spliced  
RNAs are identified by PCR analysis if two specific trans-spliceable  
cellular RNAs form, in vivo, a detectable trans-spliced hybrid. The  
primers used for analysis hybridise to previously sequenced exonic  
fragments from the trans-spliced RNA probes. The method is used for  
selective killing of tumour cells and for identifying potential trans-  
splicing sites in cellular pre-mRNAs and subsequently, natural, cellular  
trans-spliced mRNAs. The method can correct genetic defects that cause  
disease.

Cleaving single-stranded nucleic acid sequences at a desired location by  
PT contacting the nucleic acid with an single strand oligonucleotide  
PT complementary to a nucleic acid region where cleavage is desired.  
XX  
PS Disclosure; Page 481; 485pp; English.  
XX  
The present invention describes a method for cleaving single-stranded  
CC nucleic acid sequences at a desired location. Also described: (1) methods  
CC for displaying or expressing a member of a diverse family of peptides,  
CC polypeptides or proteins on the surface of a genetic package and  
CC collectively displaying at least a part of the diversity of the family,  
CC where the displayed or expressed peptide, polypeptide or protein is  
CC encoded at least in part by a nucleic acid that has been cleaved at a  
CC desired location; (2) a method for preparing single-stranded nucleic  
CC acids; (3) a method for preparing a library comprising a collection of  
CC genetic packages that display a member of a diverse family of peptides,  
CC polypeptides or proteins and that collectively display at least a portion  
CC of the family; (4) a vector comprising a DNA sequence encoding an  
CC antibody variable region linked to a version of PIII anchor which does  
CC not mediate infection of phage particles, and wild-type gene III; (5) a  
CC method for producing a population or a library of immunoglobulin genes;

CC and (6) a library of immunoglobulins that comprise members having at  
CC least one variable domain in which at least one of CDR1 and CDR2 contain  
CC synthetic diversity and CDR3 diversity is captured from B cells. The  
CC method is useful for cleaving single-stranded nucleic acid sequences at a  
CC desired location, which can be subsequently used to produce libraries of  
CC genetic packages that display and/or express a diverse family of  
CC peptides, polypeptides or proteins. AB236912 to AB237510 and AB255464 to

XX				
CC	The invention relates to a novel detection method of non-viral organisms.			
CC	The invention further relates to a novel isolated nucleic acid molecule			
CC	which has a fully defined sequence comprising 1830-5502 bp. The detection			
CC	method comprises a kit, which contains: a composition comprising the			
CC	nucleic acid probe; a pair of forward and reverse primers used for			
CC	amplifying the polynucleic acids in the biological sample; a buffer			
CC	enabling hybridization reaction between the probes contained in the			
CC				
CC	composition and the polynucleic acids present in the biological sample or			
CC	their amplified products or components necessary for producing the buffer			
CC	; a solution for washing hybrids; and optionally means for detection of			
CC	the hybrids. The novel nucleic acid is useful for preparing a composition			
CC	for diagnosing diseases caused by non-viral organisms, e.g.,			
CC	Acinetobacter baumannii, Anaerobiospirillum succiniciproducens,			
CC	Bacteroides fragilis, Cardiobacterium hominis, Chryseobacterium			
CC	meningosepticum, Clostridium ramosum, Corynebacterium diphtheriae,

PT	Amplifying for RNA in a sample, useful for improving RNA polymerase based			
PT	RNA transcription from a polynucleotide template, comprises eliminating			
PT	single-stranded oligonucleotide from the transcription sample.			

```

XX PS Example 1; SEQ ID NO 5; 26pp; English.
CC The invention relates to amplifying for RNA in a sample comprises
CC eliminating single-stranded oligonucleotide from the transcription
CC sample. The method involves synthesizing single-stranded cDNA by
CC incubating the sample RNA with reverse transcriptase and an
CC oligonucleotide primer that primes synthesis in a direction toward 5' end
CC of the RNA; converting the single-stranded cDNA into double-stranded cDNA
CC to form a transcription sample containing a cDNA template; eliminating
CC single-stranded oligonucleotide from the transcription sample; and
CC transcribing the cDNA template into RNA using an RNA polymerase. The
CC method is useful for improving RNA polymerase based RNA transcription
CC from a polynucleotide template. The method inhibits the undesired non-
CC template derived production of RNA in the transcription reaction.
CC Sequences ADI34483-ADI34489 represent oligonucleotides used in a T7 RNA
CC transcription reaction.

XX PT New antisense oligonucleotide hybridizable with a polynucleotide encoding
XX PT a polypeptide with heparanase activity, useful for treating diseases such
XX PT as cancer and autoimmune disorders.
XX PS Example; SEQ ID NO 5; 108pp; English.
XX CC The invention relates to an antisense oligonucleotide (ASO) comprising a
XX CC polynucleotide or a polynucleotide analogue of at least 10 bases being
XX CC hybridisable in vivo, under physiological conditions, with a portion of
XX CC a polynucleotide strand encoding a polypeptide having heparanase
XX CC catalytic activity. Also included are a method of in vivo downregulating
XX CC heparanase activity (comprising administering the ASO in vivo), a method

```

```

CC of treating a subject suffering from a pathological condition
CC (characterised by heparanase activity, comprising administering ASO to
CC the subject), a pharmaceutical composition comprising the ASO and a
CC carrier, an antisense nucleic acid construct (comprising a promoter
CC sequence and a polynucleotide sequence directing the synthesis of an
CC antisense RNA sequence of at least 10 bases being hybridisable in vivo,
CC under physiological conditions, with a polynucleotide strand encoding a
CC polypeptide having heparanase catalytic activity), a method of in vivo
CC downregulating heparanase activity (comprising administering in vivo the
CC antisense nucleic acid construct), a pharmaceutical composition
CC comprising the antisense nucleic acid construct and a carrier, and an
CC antisense oligonucleotide comprising a polynucleotide or a polynucleotide
CC analogue of at least 10 bases being hybridisable in vivo, under
CC physiological conditions, with a portion of a polynucleotide strand being
CC characterised by forming at least a portion of an untranslated region
CC (UTR) for a polynucleotide strand encoding a polypeptide having
CC heparanase catalytic activity. The methods and compositions of the
CC present invention are useful for the prevention and/or treatment of
CC diseases or conditions associated with aberrant heparanase activity, such
CC as heparanase-dependent cancer, cancer, autoimmune reaction and
CC inflammation. The present sequence is a PCR primer used in the isolation
CC of human heparanase cDNA.

```

XX PS Example 3; Page 31; 64pp; German.

CC The invention describes a method of typing (M1) a gene (I) that has one or more polymorphic microsatellite loci (PML). The method comprises: PCR amplification of at least one DNA region of (I) that includes PML, using as template a DNA sample containing at least one segment of (I); and determining the length of the resulting amplicon(s). Also described are: a method of determining (M2) microsatellite markers (MM) for predisposition to a disease, associated with a gene that includes one or more PML; and prediagnosis (M3) of diseases associated with gene that include PML. The method is used to identify microsatellite markers, in a disease-related gene, that are associated with a predisposition to, CC diseases and for prediagnosis of such diseases, especially prion diseases but also cystic fibrosis, malignant hyperthermia syndrome in pigs and metabolic diseases; also to type genes that encode milk proteins, CC hormones or transcription factors. The method is simpler, quicker and CC particularly less expensive than known methods based on sequencing. This CC sequence represents a primer used to genotype a region of the sheep prion CC protein (PrP) comprising a polymorphic microsatellite locus.

 PT solid support of anchor group protected by orthogonal protective group,  
 PT removing the protective group, synthesizing an oligonucleotide followed  
 PT by capping and cleaving.  
 XX  
 XX Example 9; SEQ ID NO 13; 77pp; English.  
 PS  
 XX The present invention relates to a method for the synthesis of at least  
 CC two different oligonucleotides, which involves providing a solid support  
 CC comprising anchor groups that are protected by at least two orthogonal  
 CC protective groups, removing one of the protective groups from the anchor  
 CC groups, synthesizing an oligonucleotide on the deprotected anchor group,  
 CC capping the synthesized oligonucleotide, repeating these steps until all  
 CC of anchor groups are deprotected, and cleaving the synthesized  
 CC oligonucleotides. The method can be used for the synthesis of at least  
 CC two different oligonucleotides, in the field of nucleotide chemistry, in  
 CC applying the required pairs of oligonucleotide primers, several probes at  
 CC a time, duplexed nucleic acid fragments (including PCR, sequencing,  
 CC multiplexed genotyping, cloning and RNA interference), for applying to  
 CC any known methods for the solid phase synthesis of oligonucleotides  
 CC (including phosphoramidite chemistry, H-phosphonate chemistry,  
 CC phosphotriester chemistry, or any other synthetic chemistry used to  
 CC prepare oligonucleotides on solid supports). The present sequence is a  
 CC polynucleotide used to demonstrate the method of the invention.

 CC This sequence represents a primer of the invention. The invention relates  
 CC to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta  
 CC -N3'; or (X)m5'-(gamma)k-delta-N3'; where X = a labelled compound and/or  
 CC a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n =  
 CC natural number indicating the repetition of alpha; beta = thymine; n =  
 CC V = adenine, guanine or cytosine; N = adenine, guanine, cytosine or  
 CC thymine; gamma = thymine; k = natural number of 3 or over indicating the  
 CC repetition of gamma, in which thymine expressed by gamma is composed of  
 CC 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are  
 CC useful as primers for RT-PCR and determination of base sequences. The new  
 CC sequences allow for reproductive and highly efficient analysis of gene  
 CC sequences

PT Method of inhibiting expression of genes or RNA transcripts, useful for
PT therapy and determining effects of genes, by administering oligomers
PT containing hydroxyproline nucleic acid.
XX
PS Example 17; Page 148; 240pp; English.
XX
CC The invention relates to a novel method of inhibiting the expression of
CC one or more genes or RNA transcripts by administering at least one
CC oligonucleotide analogue that includes at least one hydroxyproline
CC nucleic acid (HypNA) monomer to a cell or organism or their extracts. The
CC oligonucleotides of the invention may be used to monitor properties
CC including gene expression, respiration, secretion, signalling, ion-
CC channel activity, cell motility, developmental phenotype and tumour
CC regression. Furthermore, they may be utilised to determine the effects of
CC particular genes, as antisense or homologous recombination constructs
CC e.g. for creating animal models of disease and finally, for increasing
CC the activity of some enzymes, such as polymerases. The current sequence
CC is that of the PNA-HypNA hybridisation oligomer of the invention. This
CC sequence may also comprise phosphono-PNA (pPNA) and serine nucleic acid
CC (SerNA) components.

 XX  
 CC The present invention describes nucleic acids (A) that interact stably  
 CC with a target sequence and contain at least one phosphorodithioate  
 CC link, having endonuclease activity. (A), and more generally any catalytic  
 CC nucleic acid (A') that modulates expression of the oestrogen receptor  
 CC gene, are used to treat cancer (particularly of breast or endometrium),  
 CC in vivo or by transforming cells ex vivo and implanting treated cells, or  
 CC for other conditions associated with levels of oestrogen receptor.  
 CC Because of the high selectivity for targeted RNA, (A) can also be used to  
 CC correlate inhibition of gene expression with alterations in phenotype,  
 CC particularly for identification of therapeutic targets, and as research  
 CC reagents (for RNA, in the same way that restriction endonucleases are  
 CC used with DNA). The combination of modifications in (A) improves  
 CC resistance to nucleases, binding affinity and/or activity. AAA23503 to  
 CC AAA24747 represent oestrogen receptor hammerhead ribozyme sequences, and  
 CC AAA24748 to AAA25992 represent their corresponding target sequences.  
 CC AAA25993 to AAA26105 represent oestrogen receptor hairpin ribozyme  
 CC sequences, and AAA26107 to AAA26218 represent their corresponding target  
 CC sequences. AAA26219 to AAA26271 represent other ribozyme sequences and  
 CC antisense oligonucleotides used in the exemplification of the present  
 CC invention

 CC The invention relates to the human pollinosis-associated gene 627 which  
 CC exhibits significantly reduced expression in the T-cells of individuals  
 CC with high cedar pollen-specific IgE (immunoglobulin E) levels. The gene  
 CC was isolated from T-cells from individuals allergic to cedar pollen using  
 CC the differential display method. The invention also relates to methods of  
 CC detection of pollinosis-associated gene 627 nucleic acids; a method of  
 CC diagnosis of allergic diseases via the detection of pollinosis-associated  
 CC gene 627 nucleic acids; and a method of screening drug candidates for the  
 CC treatment of allergic disease by measuring the expression of pollinosis-  
 CC associated gene 627 in pollen antigen-stimulated T-cells in the presence  
 CC of a test compound relative to a control. Pollinosis-associated gene 627  
 CC is useful in the diagnosis of allergic diseases and in the screening of  
 CC drug candidates for the treatment of such diseases. The present sequence  
 CC represents a PCR primer used in the isolation of human pollinosis-  
 CC associated gene 627 cDNA

CC comprises determining the expression level of a gene containing, the  
 CC human cDNA appearing as ABK49633 which has homology with  
 CC acetyltransferases in the eosinophils of a patient and comparing the  
 CC expression level with that in the eosinophils of a healthy individual  
 CC (i.e. differential display). Also included are methods of screening for  
 CC candidate compounds which affect the expression level of the gene or the  
 CC activity of the protein encoded by the gene (including related proteins  
 CC and mutants), the use of probes based on the gene sequence in the  
 CC examination of allergic diseases, the use of reporter constructs in the  
 CC screening of candidate compounds, a vector containing a the transcription  
 CC -controlling region of the gene, cells transformed with the vector, an  
 CC antibody against the protein and a model animal for allergic diseases  
 CC which is a transgenic non-human vertebrate with lowering of expression  
 CC intensity of the gene in eosinophils. The method is examining allergic  
 CC diseases particularly atopic dermatitis which is also applicable in  
 CC screening candidate compounds for remedies. Such method can be performed  
 CC in high throughput, at low cost. The present sequence is a differential  
 CC display PCR primer for the cDNA encoding the human acetyltransferase-like  
 CC protein 20-90-05

 XX New IKBKAP genes with mutations, useful for identifying a subject with  
 XX familial dysautonomia (FD), or for rapid carrier screening in the  
 XX Ashkenazi Jewish population, e.g. screening presymptomatic homozygotes or

PT prenatal diagnosis.  
 XX Disclosure; Fig 11; 109pp; English.  
 XX The present invention relates to methods and compositions useful for  
 XX detecting mutations which cause Familial Dysautonomia (FD, Riley-Day  
 XX syndrome, Hereditary Sensory and Autonomic Neuropathy Type III) (OMIM  
 XX 223900). It was found that mutations in the IKBKAP gene (see ABQ80565)  
 XX are associated with FD. The mutation associated with the major haplotype  
 XX of FD, FD1 mutation, is a base pair (bp) mutation, where the thymine  
 XX nucleotide located at bp 6 of intron 20 in the IKBKAP gene is replaced  
 XX with a cytosine. This results in skipping of exon 20 in the mRNA from FD  
 XX patients, although they continue to express varying levels of wild-type  
 XX message in a tissue-specific manner. The mutation associated with the  
 XX minor haplotype, FD2 mutation, is a bp mutation, where the guanine  
 XX nucleotide at bp 2397 (bp 73 of exon 19) is replaced with a cytosine.  
 XX This bp mutation causes an arginine to proline missense mutation (R696P)  
 XX in the IKBKAP protein, which is predicted to disrupt a potential  
 XX phosphorylation site. The IKBKAP nucleic acid sequences are useful for  
 XX identifying a subject with FD and for rapid carrier screening. The IKBKAP  
 XX gene maps to chromosome 9q31. A mouse model of FD was created in an  
 XX example from the invention. Expression of murine Ikbkap was examined  
 XX using both mouse embryo and adult mouse multiple tissue Northern blots.  
 XX The blots were probed with a 1045bp PCR fragment that contains exons 2  
 XX through 11, which was generated using PCR primers ABQ80563-ABQ80564.  
 XX ABQ99682-ABQ99733 are the murine Ikbkap exon and intron boundaries

 XX Examining allergic diseases by differential display of genes showing  
 XX PT different expression particularly increase in remission stage in  
 XX PT eosinophils in patients.  
 XX Example 1; Page 54; 74pp; Japanese.

XX This invention relates to gene sequences that are differentially  
 CC expressed in eosinophils from patients with atopic dermatitis in the  
 CC increment stage as compared with those in the remission stage. These  
 CC sequences are used in a novel method for examining allergic diseases  
 CC comprising determining the expression levels of these genes and comparing  
 CC the expression level with that in the eosinophils of a healthy  
 CC individual. The method of the invention may have antiallergic or  
 CC dermatological activities. The method can be used to diagnose allergic  
 CC diseases particularly atopic dermatitis, and may also be used to screen  
 CC candidate compounds for remedies. The method of the invention can be  
 CC performed in high throughput, at low cost. The present sequence  
 CC represents the G15a PCR primer used to amplify the differentially  
 CC amplified atopic dermatitis related cDNA sequences of the invention

XX This invention relates to gene sequences that are differentially  
 CC expressed in eosinophils from patients with atopic dermatitis in the  
 CC increment stage as compared with those in the remission stage. These  
 CC sequences are used in a novel method for examining allergic diseases  
 CC comprising determining the expression levels of these genes and comparing  
 CC the expression level with that in the eosinophils of a healthy  
 CC individual. The method of the invention may have antiallergic or  
 CC dermatological activities. The method can be used to diagnose allergic  
 CC diseases particularly atopic dermatitis, and may also be used to screen  
 CC candidate compounds for remedies. The method of the invention can be  
 CC performed in high throughput, at low cost. The present sequence

CC represents the G15g PCR primer used to amplify the differentially  
 CC amplified atopic dermatitis related cDNA sequences of the invention

XX The present invention relates to nucleic acid molecules which modulate  
 CC the synthesis, expression and/or stability of Hepatitis C virus (HCV) or  
 CC Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense  
 CC and enzymatic nucleic acids such as hammerhead ribozymes, DNazymes,  
 CC inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed

are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HCV DNzyme or minus strand DNzyme sequences disclosed in the present invention

The present invention relates to murine oligonucleotides (ACC62754-ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as a component of a gene chip; in vitro as (anti)sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia

Claim 59; SEQ ID NO 2942; 317pp; English.

The invention comprises nucleic acids (e.g. antisense oligonucleotides) that down regulate the expression or inhibit the function of a receptor for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a target RNA in a cell. The present RNA sequence represents a human PKR substrate sequence.

XX Enzymatic nucleic acid molecules which specifically cleave RNA derived

PT from hepatitis C virus (HCV), useful for the treatment of HCV infections,

PT especially in combination with type I interferon therapy.

XX Claim 1; SEQ ID NO 3014; 198pp; English.

XX The invention relates to an enzymatic nucleic acid molecule which

CC specifically cleaves RNA derived from hepatitis C virus (HCV), in which

CC the binding arms of the enzymatic nucleic acid molecule comprises

CC sequences complementary to any of the defined substrate sequences given

CC in the specification. The nucleic acid molecule may be administered for

CC the treatment of HCV infections, especially in combination with type I

CC interferons. The present sequence represents a HCV DNzyme substrate

CC sequence.

(SEQU-) SEQUENOM INC.  
Roth RB, Nelson MR, Braun A, Kammerer SM, Reneland R;  
WPI; 2004-441037/41.  
Identifying a subject at risk of breast cancer by detecting the presence  
of polymorphic variations in the DLG1, KIAA0783, DPF3 or CENPC1 regions  
which are associated with breast cancer in a nucleic acid sample from a  
subject.  
Example 4; Page 78; 227pp; English.  
The present invention relates to a method for identifying a subject at  
risk of breast cancer. The method comprising detecting the presence or  
absence of one or more polymorphic variations associated with breast  
cancer in a nucleic acid sample from a subject. The nucleic acid sample  
comprises the DLG1 region (AD079402), KIAA0783 region (AD079403), DPF3  
region (AD079404) or CENPC1 region (AD079405). The gene DLG1 (discs,  
large homolog 1 (Drosophila)) is also known as synapse-associated protein  
97, hdlg or SAP97. DLG1 has been mapped to chromosomal position 3q29. The  
gene KIAA0783 is also known as PHF14 and PHD finger protein 14. KIAA0783  
has been mapped to chromosomal position 7p21.3. The KIAA0783 protein is a  
novel gene with unknown function, however, being a zinc finger protein,  
it likely to be a transcription factor. The gene DPF3 (D4, zinc and  
double PHD fingers, family 3) is also known as CERD4, cer-d4, FLJ14079  
and 2810403B03Rik. DPF3 is a Rho family guanine-nucleotide exchange  
factor. DPF3 has been mapped to chromosomal position 14q24.3-q31.1. The  
gene CENPC1 (centromere protein C1) is also known as Centromere  
autoantigen C1. CENPC1 has been mapped to chromosomal position 4q12-  
q13.3. CENPC1 is a centromere autoantigen and a component of the inner  
kinetochore plate. The CENPC1 protein is required for maintaining proper  
kinetochore size and a timely transition to anaphase. The method is  
useful for identifying a subject at risk of breast cancer, for early  
diagnosis, prevention and treatment of breast cancer, to analyze and  
predict a response to a breast cancer treatment, and in clinical drug  
trials. The present sequence was used in an example from the invention.

XX PT Functionalized nanocrystal carrying polynucleotide, used for detecting
XX target analyte, forms dendrimers with complementary nanocrystals to
XX amplify the fluorescent signal.
XX
XX PS Example 3; Page 69; 72pp; English.
XX
XX The present invention relates to functionalised nanocrystals for use in
XX nonisotopic detection systems for biomolecules e.g. nucleic acids,
XX proteins, lipids or drugs. The nanocrystals have polynucleotide strands
XX attached to their surfaces with one end of the polynucleotide extending
XX outwardly from the nanocrystal. The present sequence is one such
XX polynucleotide. These nanocrystals are used with a second series of
XX nanocrystals, which have polynucleotides complementary to the first
XX polynucleotides, so that the respective complementary strands hybridise
XX to each other and form a dendrimer. This dendrimer produces a signal
XX which can then be detected e.g. fluorescence. The present sequence is
XX composed mainly of thymine bases. This sequence may therefore be used
XX with a polynucleotide composed mainly of Adenine bases (AAZ58385)

XX PT New anti-proliferative substance comprising a radiolabeled DNA carrier,
XX PT useful for preventing or treating uncontrolled cellular proliferation
XX PT e.g. restenosis, cancer or malignant tumors.
XX PS Claim 13; SEQ ID NO 8; 28pp; English.
XX CC The invention relates to an anti-proliferative substance for preventing
XX CC uncontrolled cellular proliferation comprising a radiolabelled DNA
XX CC carrier, where a radioisotope is located internally within the DNA
XX CC sequence, at 5' end or at 3' end, and the radiolabelled DNA carrier
XX CC penetrates the cell membrane and is retained intracellularly for a time
XX CC sufficient for the radio-isotope to effect a dose therapy. The carrier in
XX CC the anti-proliferative substance is an oligonucleotide, which is linear
XX CC or a plasmid, which is circular. The plasmid is of viral or bacterial
XX CC origin. The oligonucleotide is a double- or a single-stranded DNA
XX CC sequence, which is conjugated with an antibody for cell-specific
XX CC delivery. The oligonucleotide is also conjugated to a stent surface,
XX CC cholesterol, oleic acid, linoleic acid, TGFalpha, antibody, TGFbeta,
XX CC cytokines or growth factors. The anti-proliferative substance is useful
XX CC for preventing or treating uncontrolled cellular proliferation. The
XX CC uncontrolled cell proliferation is a restenosis following angioplasty, or
XX CC cancer or a malignant tumour. The present sequence represents an
XX CC oligonucleotide carrier used in the invention.

 CC The sequences given in AAQ35720-23 were used to generate an expression  
 CC cassette for the insertion of the equine influenza virus (EIV)  
 CC hemagglutinin (HA) (A1/Prague/56) into NYVAC and ALVAC recombinant  
 CC vectors. The HA gene sequence was isolated from an EIV cDNA library and  
 CC was amplified by polymerase chain reaction. The amplified sequence was  
 CC inserted into the linearised plasmid pRW764.2. The resultant plasmid was  
 CC designated pPCV1 and contains the vaccinia virus H6 promoter followed by  
 CC a polylinker region and flanked by canarypox virus homologous sequences.  
 CC NYVAC is derived from a Copenhagen vaccine strain of vaccinia virus and  
 CC ALVAC is derived from a canarypox virus which has been modified by  
 CC deletion of non-essential regions of the genome encoding known or  
 CC potential virulence factors. The deletion loci of both vectors were  
 CC engineered as recipient loci for the insertion of foreign genes. See also  
 CC AAQ35501-864. (Updated on 25-MAR-2003 to correct PN field.)

 DR New compositions comprising tyrosine phosphatase PTP10D, protein tyrosine  
 PT kinase Tec or egg-derived tyrosine phosphatase genes or proteins, useful  
 PT for treating or preventing metabolic diseases, e.g. as obesity or  
 PT cachexia.  
 XX Example 4; Page 52; 83pp; English.  
 PS The present invention describes a pharmaceutical composition comprising a  
 CC nucleic acid (i) protein tyrosine phosphatase PTP10D, non-receptor  
 CC protein tyrosine kinase Tec, egg derived tyrosine phosphatase (EDTP) gene  
 CC family or encoded polypeptide, fragment or variant of nucleic acid  
 CC molecule or polypeptide, an antibody, an aptamer or receptor recognising  
 CC a nucleic acid molecule of PTP10D, Tec, or EDTP gene family or encoded  
 CC polypeptide, and a carrier, diluent and/or adjuvant. The pharmaceutical  
 CC composition can have antidiabetic, hypotensive, cardiant, antilipaeamic,  
 CC osteopathic, cytostatic, anorectic and immunomodulator activities, and  
 CC can be used in gene therapy. The composition is useful for the  
 CC manufacture of an agent for detecting and/or verifying, for treating and  
 CC alleviating and/or preventing a disorder, including metabolic diseases  
 CC such as obesity and other body weight regulation disorders, as well as  
 CC related disorders such as eating disorder, cachexia, diabetes mellitus,  
 CC hypertension, coronary heart disease, hypercholesterolaemia,  
 CC dyslipidaemia, osteoarthritis, gallstones, cancers (cancers of the  
 CC reproductive organ), sleep apnea, and other diseases, in cells, cell  
 CC masses, organs and/or subjects. The components of the composition may  
 CC also be used in controlling the function of a gene and/or gene product  
 CC which is influenced and/or modified by a PTP10D, Tec, or EDTP homologous  
 CC polypeptide, and for identifying substances capable of interacting with a  
 CC PTP10D, Tec, or EDTP homologous polypeptide. The nucleic acid molecule of  
 CC PTP10D, Tec, or EDTP family or their fragments, may be used in the  
 CC preparation of a non-human animal which over- or under-expresses the  
 CC PTP10D, Tec, or EDTP gene product. The present sequence represents a PCR  
 CC primer for mouse protein tyrosine phosphatase receptor type B precursor  
 CC (PTRB), which is used in an example from the present invention

 DR Kit for diagnosing and treating T-cell associated diseases e.g.  
 PT autoimmune, degenerative nervous system and infectious disease, comprises  
 PT nucleic acid primers specifically priming and allowing amplification of a  
 PT Vbeta gene.  
 PS Disclosure; SEQ ID NO 716; 164pp; English.  
 XX The invention relates to a kit for diagnosing and treating T-cell  
 CC associated diseases which comprises a panel of nucleic acid primers  
 CC specifically priming and allowing amplification of each Vbeta gene,  
 CC VbetaRNA or cDNA. The kit is useful for diagnosing organ transplant  
 CC rejection and diagnosing and treating T-cell associated diseases  
 CC including autoimmune diseases, degenerative nervous system diseases,  
 CC graft versus host disease, hypersensitivity diseases, infectious diseases  
 CC and neoplastic diseases. Autoimmune diseases include Addison's disease,  
 CC atrophic gastritis. Degenerative nervous system diseases include multiple  
 CC sclerosis and Alzheimer's disease. Hypersensitivity diseases include Type  
 CC I hypersensitivities such as contact with allergens that lead to  
 CC allergies. Type II hypersensitivities such as those present in  
 CC Goodpasture's syndrome and Type IV hypersensitivities such as those  
 CC manifested in leprosy. Infectious diseases include viral infections  
 CC caused by viruses such as HIV, fungal infections such as those caused by  
 CC the yeast genus Candida, parasitic infections such as those caused by  
 CC schistosomes, filaria and bacterial infections such as those caused by  
 CC Mycobacterium. Neoplastic diseases include lymphoproliferative diseases  
 CC such as leukaemias, lymphomas and cancers such as cancer of the brain,  
 CC breast. The present sequence represents a Vbeta gene repeat sequence.

XX
XX Minisequencing type oligonucleotide chip for detecting methylation of
XX promoter CpG islands of multiple genes, useful for detecting cancer.
XX
XX Claim 13; SEQ ID NO 878; 248pp; Korean.
XX
XX This invention relates to a novel mini-sequencing type DNA
XX oligonucleotide chip. Specifically, it refers to a chip that is useful
XX for detecting methylation of promoter CpG islands occurring in multiple
XX genes. The present invention describes using oligonucleotide primers to
XX determine the position of a target gene and promoter CpG islands, this
XX constitutes treating DNA of the target gene with sodium bisulfite in
XX order to carry out methylation specific (MSP) PCR or multiplex MSP PCR to
XX amplify the sodium bisulfite treated DNA and sequencing the PCR product
XX to confirm the hypomethylation site of the promoter CpG islands of
XX multiple genes. Accordingly, the chip comprises primer sequences designed
XX from these PCR products that have amine linkers of 12 carbons attached to
XX the 5'-terminal, which are spotted onto the glass slide coated with 3-
XX aminopropyltrimethoxylan and 1,4-diisothiocyanate using an array robot.
XX The resulting minisequencing chip is useful for detecting cancer, thereby
XX accurately and rapidly detecting methylation of CpG islands of multiple
XX genes. This oligonucleotide sequence is a PCR primer given in an
XX exemplification of the invention.

 XX  
 XX PT Sensitive detecting proximity changes in a system that utilizes an interacting fluorophore and quencher, for high sensitivity applications, involves utilizing a metal surface as quencher.  
 XX  
 XX PS Example 3; Page 30; 62pp; English.  
 XX  
 XX The present sequence is that of a single mismatch target sequence for a molecular beacon comprising an oligonucleotide probe (see ABL57069) covalently attached at the 3' end to fluorescent dye and at the 5' end to a nanoparticle. In the native state, the probe forms a hairpin conformation with hybridised termini. The proximity of the fluorophore

CC and quencher (gold nanoparticle) in the molecular beacon results in  
 CC little or no detectable fluorescence. Upon hybridisation of the central  
 CC complementary stretch of the probe to a target sequence, such as the  
 CC present sequence, the hairpin undergoes a conformational change resulting  
 CC in an increase in fluorescence, the extent of which is proportional to  
 CC the amount of target sequence present. Experiments with the present  
 CC sequence and a perfectly-matched target (see ABL57071) showed that  
 CC hybridisation was very specific to the matched target. The invention  
 CC relates generally to the use of metal surface quenchers such as particles  
 CC or films for high sensitivity applications in, for example, detection and  
 CC diagnostic systems

 XX PT New nucleic acid that modulates expression of the vanilloid receptor-1,  
 PT useful for control of pain or sensitivity disorders, comprises sequences  
 PT from control regions of the receptor gene.  
 XX PS Disclosure; Page 48; 68pp; German.  
 XX CC This invention describes a novel nucleic acid containing a specific  
 CC segment having at least one region that modulates expression of the VR1  
 CC (vanilloid receptor type 1) receptor, or a functional derivative, allele  
 CC or fragment of this region, or a sequence that hybridises to it under  
 CC standard conditions. The VR1 modulator is derived from one or more of  
 CC positions 221931-223344 of GenBank AL670399, 31673-36359 of AL663116, or  
 CC 44731-43231 or 36616-33151 of AF168787 and is involved in transmission of  
 CC pain, particularly in primary sensory neurons. The invention also  
 CC describes a vector that contains the VR1 modulator, host cells containing  
 CC this vector (other than human germ or embryonal stem cells) and a method  
 CC for modulating expression of the VR1 receptor by introducing the  
 CC modulator or the vector into a cell that contains the VR1 gene. The  
 CC products of the invention are used for detecting a transcription factor  
 CC from its binding to a regulatory sequence (or a double-stranded  
 CC oligonucleotide fragment of it), e.g. by Western blotting or enzyme-  
 CC linked immunosorbant assay, particularly for diagnosis of diseases  
 CC associated with overexpression or underexpression of the transcription  
 CC factor. The region that modulates VR1 receptor expression includes a  
 CC binding site for a transcription factor, e.g. MZP1, NfkappaB, NFAT or  
 CC GAT1. The nucleic acids of the invention, or vectors containing them,  
 CC are used for prevention or treatment of pain, also for treating  
 CC sensitivity disorders, e.g. analgesia, hyperalgesia or hyperalgesia, also  
 CC neuralgia and myalgia, that are associated with activity of the VR1  
 CC receptor. This sequence represents a fragment of rat VR1 exon 1d DNA  
 CC which is capable of binding to a transcription factor.

XX Analyzing binding between macromolecules, useful for detecting nucleic

PT acids by hybridization, where a labeled detector molecule is immobilized

PT and becomes fluorescent only after specific binding.

XX Example; Page 6; 11pp; German.

PS

XX The invention relates to a novel analytical method for examining binding

CC events between first and second macromolecules. The method comprises

CC preparing a surface on which a fluorescently-labelled first macromolecule

CC is bound and which is at least partly fitted with a fluorescence-

CC suppressing layer. A sample liquid containing the second macromolecule is

CC applied and fluorescence is measured. The first macromolecule has a

CC secondary structure such that its fluorescence is suppressed by the

CC suppressing layer when it is not specifically bound to the second

CC macromolecule, but fluorescence is not suppressed when the two

CC macromolecules are specifically bound. The method of the invention may be

CC used to detect hybridisation of RNA or, particularly DNA, especially for

CC detecting the presence of particular sequences in samples, but also for

CC studying reaction kinetics. The method allows the use of molecular

CC beacons that are simple to prepare or synthesise, particularly because

CC they do not require incorporation of a quencher. The current sequence is

CC that of the control probe of the invention which is targeted to the

CC fluorescent-labelled and bound DNA oligonucleotide in the binding

CC analysis method.

XX Enzymatic nucleic acid molecules having a hammer-head motif - used for

PT the treatment of arthritis, induction of graft tolerance or treatment of

PT auto-immune diseases.

XX Example 1; Page 154; 307pp; English.

XX The present invention describes a novel enzymatic nucleic acid (ENA)

CC having a hammerhead motif (HM) comprising: (i) at least 5 ribose residues

CC ; (ii) a 2'-C-allyl modification at position 4 of the ENA; (iii) at least

CC ten 2'-O-methyl modifications; and (iv) a 3'-end modification. The ENA's

CC can inhibit collagenase and stromelysin production in the synovial

CC membrane of joints for the treatment or prevention of arthritis,

CC particularly osteoarthritis or rheumatoid arthritis. The ENA's can also

CC be used to treat antigen presenting cells of a donor to induce tolerance

CC in a recipient to an alloantigen of a donor. They can also be used for

CC enhancing graft tolerance or for treating autoimmune disease, and for

CC treating allergies and other inflammatory conditions. The ENA's can also

CC stromelysin without introducing the non-specific effects upon gene

CC expression which accompany treatment with retinoids and dexamethasone.

CC The concentration of ribozyme required to affect a therapeutic treatment

CC is lower than that required of antisense molecules, and is highly

CC specific. The present sequence is used in the exemplification of the

CC present invention

 XX  
 PS Claim 177; Page 168; 259pp; English.  
 XX  
 CC A method has been developed for the identification of a nucleic acid  
 CC capable of modulating a process in a biological system. The method

comprises: (a) introducing into the system a random library of nucleic acid catalysts (NAC) having a substrate binding domain (SBD), comprising a random sequence, and a catalytic domain (CD); and (b) identifying NAC in systems where modulation has occurred and/or determining the sequence of at least part of the SBDs in such systems. Nucleic acid molecules with endonuclease activity and catalytic activity, from the present invention, are used to modulate gene expression in plant and mammalian cells and to cleave target nucleic acid, particularly for treating systemic diseases caused by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepatic ascites and infection. They may also be used to detect genetic drift and mutations in diseased cells and to determine c-ras RNA. Specifically NACs with RNA-cleaving activity that modulate expression of the Raf gene, are used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or generally any condition associated with the level of c-ras. Introduction of sugar/phosphate modifications increases stability against nuclease and activity. AAV90922 to AAV93877 represent NACs that can be used in the method, specifically for modulating the expression of a Raf gene

PT New nucleic acids that interact, and optionally cleave, target sequences, used to treat cancer.

PS Claim 77; Page 79; 148pp; English.

XX The present invention describes nucleic acids (A) that interact stably with a target sequence and contain at least one phosphorodithioate link, having endonuclease activity. (A), and more generally any catalytic nucleic acid (A') that modulates expression of the oestrogen receptor gene, are used to treat cancer (particularly of breast or endometrium),

CC in vivo or by transforming cells ex vivo and implanting treated cells, or for other conditions associated with levels of oestrogen receptor.

CC Because of the high selectivity for targeted RNA, (A) can also be used to correlate inhibition of gene expression with alterations in phenotype, particularly for identification of therapeutic targets, and as research reagents (for RNA, in the same way that restriction endonucleases are used with DNA). The combination of modifications in (A) improves resistance to nucleases, binding affinity and/or activity. AAA23503 to AAA24748 represent oestrogen receptor hammerhead ribozyme sequences, and AAA25993 to AAA26105 represent oestrogen receptor hairpin ribozyme sequences.

CC AAA24748 to AAA25992 represent their corresponding target sequences, and AAA26107 to AAA26218 represent their corresponding target sequences. AAA26219 to AAA26271 represent other ribozyme sequences and antisense oligonucleotides used in the exemplification of the present invention

XX Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense

constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.

Claim 88; Page 68; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NIGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNzyme) an inozyme (an endolytic nucleic acid cleaving a RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) or an amberyyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA with a YGY motif). The CD20-targeting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably  $Mg^{2+}$ . Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targeting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, immune thrombocytopenia, and inflammatory arthropathy. The NIGO-targeting nucleic acid is used to cleave RNA of the NIGO gene in the presence of a divalent cation that is preferably  $Mg^{2+}$ . Furthermore, the nucleic acid may be contacted with a cell to reduce NIGO activity of the cell and treat a patient having a condition associated with the level of NIGO. The treatment may further comprise the use of one or more therapies. In particular, the NIGO-targeting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob disease, muscular dystrophy, and/or other neurodegenerative disease states which respond to the modulation of NIGO expression. The present sequence is a hammerhead ribozyme of the invention

PT New device useful for mapping mRNA transcripts and determining regions that may be effective targets for antisense mediated gene knockdown used for controlling gene expression for research or therapeutic purposes.

PT  
XX Disclosure; Page 7; 25pp; English.

XX  
CC The present invention provides a device and method for mapping mRNA transcripts and determining regions that may be effective targets for antisense mediated gene knockdown. Multiple oligonucleotides are immobilised at the same position on an array in the form of complex elements. Labelled target RNA is added to the array and allowed to anneal to any complementary oligonucleotides. The array is then scanned for signals and overlaps between the elements are identified. The mixture of oligonucleotides comprising each complex element is such that data can be obtained and interpreted. An oligonucleotide may be spaced from the array by extending its 5' or 3' end using spacers nucleotides or nucleotide analogues. For example, the present sequence may be used to space the 6-base sequence 5'-CGGAAC-3' from the array

 XX PR New polypeptide, for raising antibodies that recognize hGDMPLP-1 proteins,  
 XX PT or as specific biomolecule capture probes for surface-enhanced laser  
 XX PT desorption ionization, comprises human myosin-like protein hGDMPLP-1.  
 XX PS Disclosure; SEQ ID NO 10038; 214pp; English.  
 XX CC The present invention describes a human genome-derived myosin-like  
 CC protein 1 (hGDMPLP-1). The protein and polynucleotide sequences of hGDMPLP-  
 CC 1 can be used in gene therapy and vaccine production. The hGDMPLP-1  
 CC nucleic acids can be used as probes to detect, characterise and quantify  
 CC hGDMPLP-1 nucleic acids in samples, as amplification substrates, to  
 CC provide initial substrates for the recombinant engineering of hGDMPLP-1  
 CC protein variants having desired phenotypic improvements, and for  
 CC expressing the proteins. The hGDMPLP-1 proteins or polypeptides may be  
 CC used as immunogens to raise antibodies that specifically recognise hGDMPLP  
 CC -1 proteins, as standards in assays used to determine the concentration  
 CC and/or amount specifically of hGDMPLP proteins, as specific biomolecule  
 CC capture probes for surface-enhanced laser desorption/ionisation, as  
 CC therapeutic supplement in patients having specific deficiency in hGDMPLP-1  
 CC production, and in vaccines or for replacement therapy. The  
 CC polynucleotide sequences encoding hGDMPLP-1 may be used for diagnosing a  
 CC disorder associated with the expression of hGDMPLP-1, in particular heart  
 CC and skeletal muscle disorders. hGDMPLP-1 is localised to chromosome 22.  
 CC The present sequence represents an oligomer used in the screening of the  
 CC hGDMPLP-1 sequence in the exemplification of the present invention. N.B.  
 CC The sequence data for this patent did not form part of the printed  
 CC specification, but was obtained in electronic format directly from WIPO  
 CC at ftp.wipo.int/pub/published\_pct\_sequence

 PT New nucleic acid molecule that modulates replication of West Nile Virus  
 PT (WNV), useful for treating a condition related to WNV infection e.g.  
 PT pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.  
 XX  
 PS Claim 23; SEQ ID NO 4503; 495pp; English.  
 XX  
 CC The invention relates to nucleic acid molecules that modulate replication  
 CC of the West Nile Virus (WNV). The nucleic acid molecules are useful for  
 CC treating a condition related to WNV infection e.g. pancreatitis,  
 CC encephalitis, myocarditis, meningitis, neurologic infection, hepatitis,  
 CC liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid  
 CC molecule is selected from the group of ribozymes consisting of  
 CC Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyne. The  
 CC nucleic acid molecules further comprise at least five ribose residues, at  
 CC least ten 2'-O-methyl modifications, phosphorothioate linkages on at  
 CC least three of the 5' terminal nucleotides and a 3' end modification of a  
 CC 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080  
 CC are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given  
 CC in the specification. The present sequence is that of a nucleic acid  
 CC molecule of the invention

 XX  
 CC The present invention relates to novel human zinc finger-containing  
 CC proteins and their coding sequences: MD23, MD24, MD27, MD212. MD23 is  
 CC encoded at chromosome 7q22.1, MD24 is encoded at chromosome 6p21.3-22.2,  
 CC MD27 is encoded at chromosome 16p11.2 and MD212 is encoded at chromosome  
 CC 15q26.1. The MD23, MD24, MD27, and MD212 sequences are useful in therapy,  
 CC or in manufacturing a medicament for treating or preventing a disorder  
 CC associated with decreased or increased expression or activity of MD23,  
 CC MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic  
 CC acids and proteins are also useful for diagnosing or monitoring a disease  
 CC caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic  
 CC acids can also be used as probes to detect and characterize gross  
 CC alterations in MD23, MD24, MD27, or MD212 genetic locus. The probes are  
 CC useful in constructing microarrays for measuring gene expression. The  
 CC proteins are useful as therapeutic agents for gene therapy or as  
 CC vaccines. The present sequence was used to illustrate the invention.

 PT HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.  
 XX  
 PS Claim 58; Page 116; 185pp; English.

XX The invention relates to a novel short interfering RNA (siRNA) nucleic  
 CC acid molecule or an enzymatic nucleic acid molecule, that modulates  
 CC expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras,  
 CC human immunodeficiency virus (HIV) or a component of HIV. The nucleic  
 CC acid molecule of the invention has cytostatic, anti-HIV, and anti-  
 CC rheumatic activity. The nucleic acid molecules are useful for reducing  
 CC HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are  
 CC also useful for treating breast, ovarian, colorectal, lung, prostate,  
 CC bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences

 PT infection.  
 XX  
 PS Claim 1; Page 261; 387pp; English.

XX The present invention relates to nucleic acid molecules which modulate  
 CC the synthesis, expression and/or stability of Hepatitis C virus (HCV) or  
 CC Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense  
 CC and enzymatic nucleic acids such as hammerhead ribozymes, DNazymes,  
 CC inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed  
 CC are nucleic acid decoy molecules and aptamers that bind to HBV reverse

transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HCV DNzyme or minus strand DNzyme sequences disclosed in the present invention

XX New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related polypeptide and antibodies.

XX Disclosure; Page 493; 771pp; French.

CC The invention relates to the isolation of 6327 nucleotide sequences,  
CC fragments of at least 15 consecutive nucleotides of these nucleotides, a  
CC sequence having at least 80% identity, after optimal alignment, with the  
CC nucleotides, a sequence that hybridizes under stringent conditions with  
CC the nucleotides, or the complement, or corresponding RNA, of the  
CC nucleotides. The nucleotides are used as probes or primers for detecting,  
CC identifying, quantifying and/or amplifying nucleic acids, as in vitro  
CC sense and antisense sequences, of nucleotides involved in tumour  
CC suppression or reversion, apoptosis and or viral resistance, to produce  
CC recombinant polypeptides, and to prepare transgenic animals, as  
CC experimental models. The nucleotides (also vectors containing them and  
CC cells containing the vectors), the encoded polypeptides and antibodies  
CC (Ab) against the polypeptide are useful for prevention and/or treatment  
CC of viral infections or diseases characterized by development of tumours  
CC or cell degeneration (e.g. Alzheimer's disease or schizophrenia).  
CC Analysis of the expression of the nucleotides can be used for diagnosis  
CC and/or prognosis of these diseases. The nucleotides and polypeptides can  
CC also be used to screen for their specific interactive molecules,  
CC potentially useful for treating diseases associated with abnormal  
CC expression of the nucleotides.

XX Determining structural parameters of native RNA involves applying RNA to  
PT an oligonucleotide array and detecting binding of RNA using RNA dependent  
PT nucleic acid modifying enzymes.  
XX

XX Disclosure; Page 8; 24pp; English.  
PS

XX The present invention describes a method for determining structural  
CC parameters of native RNA by detecting binding of the native RNA to an  
CC oligonucleotide array. The method comprises applying native RNA to  
CC complementary oligonucleotides which anneal to accessible sequences in  
CC the RNA, adding an RNA dependent nucleic acid modifying enzyme, removing  
CC any unbound RNA, enzyme or other reaction components and detecting  
CC modification(s) caused by the enzyme. Also described is a device for  
CC determining structural parameters of native RNA by mapping RNA  
CC transcripts, comprising an array which has immobilised oligonucleotides  
CC represented on a surface support, where the oligonucleotides represented  
CC have a reactive-OH group at their free 3' end, and units for extending  
CC the 3'-OH group that is dependent on a complementary bp interaction  
CC between specific immobilised oligonucleotides and the applied RNA. The  
CC method is useful for determining structural parameters of native RNA. The  
CC device is useful for carrying out the method and for mapping RNA  
CC transcripts, and determining regions that may be effective targets for  
CC antisense mediated gene knockdown. The present sequence represents an  
CC oligonucleotide which is given in the exemplification of the present  
XX invention

XX  
PS Example 1; SEQ ID NO 4; 14pp; English.  
XX  
CC The invention relates to a device for storage and analysis of a nucleic  
CC acid containing a moiety in a biological sample, comprising a filter  
CC layer comprising a dry solid medium comprising a hydrophilic solid  
CC matrix, and an isolation layer comprising a dry solid medium comprising a  
CC neutral solid matrix attached to a composition comprising a detergent.  
CC Storing and analysing a nucleic acid containing a moiety in a biological  
CC sample comprises applying a biological sample to the filter layer,  
CC filtering the components of the biological sample through the filter  
CC layer to the isolation layer, retaining the nucleic acid components in  
CC the isolation layer while removing the non-nucleic acid components,  
CC drying the isolation layer, providing a primer and analysing the nucleic  
CC acid components using at least one primer. The device and method are  
CC useful for storing and analysing a nucleic acid containing a moiety in a  
CC biological sample. They are also useful for identifying known or unknown  
CC viruses or bacteria contained in a fluid. This sequence represents a  
CC reverse transcriptase PCR (RT-PCR) primer used in the scope of the  
CC invention.

PS Claim 59; SEQ ID NO 2938; 317pp; English.  
XX  
CC The invention comprises nucleic acids (e.g. antisense oligonucleotides)  
CC that down regulate the expression or inhibit the function of a receptor  
CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),  
CC IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the  
CC invention are useful for treating: cerebrovascular accident, central  
CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,  
CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,  
CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune  
CC disease, lupus, multiple sclerosis, transplant/graft rejection,  
CC ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic  
CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The  
CC nucleic acids of the invention are also useful for down-regulating the  
CC expression of a target gene and as a diagnostic tool to examine genetic  
CC drifts and mutations within diseased cells or to detect the presence of a  
CC target RNA in a cell. The present RNA sequence represents a human PKR  
CC substrate sequence.

 XX Novel enzymatic nucleic acid molecule such as DNazymes and inozymes  
 PT specifically cleaving RNA derived from hepatitis B virus and comprising  
 PT one or more binding arms, useful for treating hepatitis and cirrhosis.  
 XX  
 PS Disclosure; SEQ ID NO 1745; 122pp; English.  
 XX  
 CC The invention relates to an enzymatic nucleic acid molecule that  
 CC specifically cleaves RNA derived from hepatitis B virus (HBV) and  
 CC comprising one or more binding arms, without requiring the presence of a  
 CC 2'-OH group within the molecule for activity. The nucleic acids are  
 CC useful for treating hepatitis B virus infection, hepatitis,  
 CC hepatocellular carcinoma, cirrhosis and liver failure, either alone or in  
 CC combination with other therapies such as lamivudine and interferons. The  
 CC nucleic acids are useful as diagnostic tools to examine genetic drift and  
 CC mutations within diseased cells, for detecting the presence of HBV RNA in  
 CC a cell, for the study of RNA and for down-regulating gene expression of  
 CC target genes in bacterial, fungal, viral, plant or mammalian cells. This  
 CC sequence represents an HBV RNA target sequence, used in the scope of the  
 CC invention. Note: The sequence data for this patent is also available in  
 CC electronic format from USPTO at seqdata.uspto.gov/sequence.html.

 XX Novel myosin-like protein-1, useful for treating or preventing disorder  
 PT associated with decreased expression or activity of human genome-derived  
 PT myosin-like protein-1 such as disorder of heart and/or skeletal muscle  
 PT function.  
 XX  
 PS Disclosure; SEQ ID NO 10037; Opp; English.  
 CC  
 XX The invention relates to a novel polypeptide (I) comprising a sequence  
 CC (S1) of myosin-like protein-1 (hGDMPLP-1) having 2568 amino acids fully  
 CC defined in the specification, a fragment of at least 8 amino acids of  
 CC (S1), 95% deviation from (S1) which are conservative substitutions, and  
 CC 65% identity to (S1). A polypeptide of the invention acts as an agonist or  
 CC antagonist of hGDMPLP-1, or as an inhibitor of hGDMPLP-1 activity. A  
 CC pharmaceutical composition of the invention is useful for treating or  
 CC preventing a disorder associated with decreased expression or activity of  
 CC hGDMPLP-1, such as a disorder of heart and/or skeletal muscle function.  
 CC The present sequence represents a 17-mer nucleotide, used in the  
 CC invention for scanning the sequence represented in ACN63103

PS
XX
XX In a sequence-sample mapping procedure using a Giardia lamblia 20-genome
CC equivalent cosmid library, each end of the genomic insert in a cosmid was
CC detected as a vector/genomic chimera by hybridisation with probes
CC flanking the T3 and T7 promoter sites of sCos-1. The 1046 bp T3 probe was
CC amplified from sCos-1 with the primers AAQ80946 and AAQ80947 and the 1004
CC bp T7 probe was amplified with the primers AAQ80948 and AAQ80949. The T7
CC probe was labelled with 35S- dATP and the T3 probe with 33P-dATP for dual
CC -label hybridisations. Maps were constructed by determining an order of
CC fragments with no gaps using a computer program. (Updated on 25-MAR-2003
CC to correct PN field.)

 PT gene, which specifically hybridize to mRNA expressed from the gene useful  
 PT for treating disorders related to elevated glutamate level such as pain.  
 XX  
 PS Claim 2; Page 18; 97pp; English.  
 XX  
 CC The present invention relates to an antisense oligonucleotide derived  
 CC from the sequence of metabotropic glutamate receptor type 1 (mGluR1)  
 CC gene. The antisense oligonucleotide binds to a portion of mRNA expressed  
 CC from the gene or its splice variant. The binding of the oligonucleotide  
 CC to the mRNA is effective in decreasing the translation of the mRNA in a  
 CC host cell expressing the gene. The oligonucleotides are useful for  
 CC treating chronic pain caused by injury or inflammation of a nerve caused  
 CC by arthritis. The oligonucleotides may be used with an opioid analgesic.  
 CC They are also useful for minimizing glutamate neurotoxicity and/or  
 CC excitotoxicity associated with stroke, ischemia, CNS trauma,  
 CC neurodegenerative disorders, gastrointestinal disorders or to inhibit  
 CC tumour formation

 PT New isolated polynucleotides comprising single nucleotide polymorphisms

PT of the cardiovascular gene, useful for assessing predisposition or  
 PT susceptibility to a cardiovascular disease, e.g. atherosclerosis,  
 XX restenosis or stroke.

PS Disclosure; Page 78; 187pp; English.

XX  
 CC The invention relates an isolated polynucleotide (I) encoded by a  
 CC cardiovascular associated (CA) gene, having allelic variation contained  
 CC in a functional surrounding like full length cDNA for CA gene  
 CC polypeptide, and with or without the CA gene promoter sequence. (I) is a  
 CC polynucleotide comprising single nucleotide polymorphisms predicting  
 CC cardiovascular disease. The polynucleotides are useful for assessing  
 CC predisposition or susceptibility to a cardiovascular disease, e.g.  
 CC atherosclerosis, ischemia/reperfusion, hypertension, restenosis, arterial  
 CC inflammation, myocardial infarction, and stroke. These may also be used  
 CC to predict personal medication schemes omitting adverse drug reactions,  
 CC or as probes for detecting genetic polymorphisms and as templates for the  
 CC recombinant production of normal or variant peptides/polypeptides encoded  
 CC by the genes. This sequence corresponds to a PCR primer to amplify one of  
 CC the genes of the invention.

PT Kit for diagnosing and treating T-cell associated diseases e.g.  
 PT autoimmune, degenerative nervous system and infectious disease, comprises  
 PT nucleic acid primers specifically priming and allowing amplification of a  
 XX Vbeta gene.

XX PS Disclosure; SEQ ID NO 1251; 164pp; English.

XX The invention relates to a kit for diagnosing and treating T-cell  
 CC associated diseases which comprises a panel of nucleic acid primers  
 CC specifically priming and allowing amplification of each Vbeta gene,  
 CC VbetaRNA or cDNA. The kit is useful for diagnosing organ transplant  
 CC rejection and diagnosing and treating T-cell associated diseases,  
 CC including autoimmune diseases, degenerative nervous system diseases,  
 CC graft versus host disease, hypersensitivity diseases, infectious diseases,  
 CC and neoplastic diseases. Autoimmune diseases include Addison's disease,  
 CC atrophic gastritis. Degenerative nervous system diseases include multiple  
 CC sclerosis and Alzheimer's disease. Hypersensitivity diseases include type  
 CC I hypersensitivities such as contact with allergens that lead to  
 CC allergies, Type II hypersensitivities such as those present in  
 CC Goodpasture's syndrome and Type IV hypersensitivities such as those  
 CC manifested in leprosy. Infectious diseases include viral infections  
 CC caused by viruses such as HIV, fungal infections such as those caused by  
 CC the Yeast genus Candida, parasitic infections such as those caused by  
 CC schistosomes, filaria and bacterial infections such as those caused by  
 CC Mycobacterium. Neoplastic diseases include lymphoproliferative diseases  
 CC such as leukaemias, lymphomas and cancers such as cancer of the brain,  
 CC breast. The present sequence represents a Vbeta point mutation PCR  
 CC primer.

XX  
XX This sequence represents a primer of the invention. The invention relates  
CC to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta  
CC -N3'; or (X)m5'-(gamma)k-delta-N3'; where X = a labelled compound and/or  
CC a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n =  
CC natural number indicating the repetition of alpha; beta, delta = V or N;  
CC V = adenine, guanine or cytosine; N = adenine, guanine, cytosine or  
CC thymine; gamma = thymine; k = natural number of 3 or over indicating the  
CC repetition of gamma, in which thymine expressed by gamma is composed of  
CC 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are  
CC useful as primers for RT-PCR and determination of base sequences. The new  
CC sequences allow for reproductive and highly efficient analysis of gene  
CC sequences

CC and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of  
 CC 50 clones cross-hybridised. Assuming independant distribution of  
 CC microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites  
 CC in the bovine genome is estimated at >100, 000. The sequence information  
 CC for ca. 230 such bovine microsatellites is summarised in the  
 CC specification and indexed herein (see below). The sequences upstream and  
 CC downstream of the microsatellite sequence were used to generate the  
 CC required PCR primers for in vitro amplification of the corresp.  
 CC microsatellite (using the program OPTIPRIM). The microsatellites may be  
 CC used to identify individuals, for parentage testing, and in the genetic  
 CC mapping of economic trait loci, or genes involved the determinism of  
 CC economically important traits esp. in cattle, to allow selective  
 CC breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN  
 CC field.)

XX Identifying DNA encoding inducible or suppressible cytochrome P450 - by  
 PT screening for drugs which reduce the catabolism of retinoic acid, useful  
 PT in cancer chemotherapy and the treatment of acne and psoriasis.

XX Example 1; Page 51; 113pp; English.

XX This is a 3' poly(T) PCR primer used in the amplification of the  
 CC inducible cytochrome P450RAI gene which specifically metabolises a  
 CC derivative of the retinoic acid (RA). The cytochrome P450 gene in general  
 CC produces enzymes involved in the oxidative metabolism of endogenous and  
 CC exogenous compounds. The cytochrome P450 nucleotide sequence can be used  
 CC to induce or suppress the expression of its protein. P450RAI is highly  
 CC induced by RA in cell lines and tissues. This allows for the development  
 CC of a drug screen using promoters and nucleotide sequences to identify  
 CC drugs which are useful for reducing the catabolism of RA

XX Disclosure; Page 14; 110pp; English.

XX PolyT oligonucleotides (see AAV12217-28) were used in reverse  
 CC transcription reactions on polyA+ RNA isolated from the fins of control  
 CC or retinoic acid-treated zebrafish (Danio rerio). Several combinations of  
 CC the polyT primers were used with degenerate upstream primers (see  
 CC AAV12229-33) for differential display PCR. Bands demonstrating  
 CC reproducible differential amplifications were found using the primers  
 CC given in AAV12221 and AAV12231. This PCR product was reamplified (see  
 CC AAV12234-35). A differential display product (see AAV12213) which  
 CC exhibited a dependence on the presence of retinoic acid for its  
 CC expression was isolated, and was used to isolate a full-length clone (see  
 CC AAV12203) coding for a novel retinoid metabolising protein (see  
 CC AAW44159), designated zP450RAI

PT reporter released if triplex formation occurs, used e.g. to identify  
PT bacteria.  
PS Disclosure; Col 15-16; 168pp; English.  
XX  
XX The present sequence represents a polynucleotide that is able to form a  
CC triple helix with a double stranded sequence. Cytosine bases in the  
CC present can be replaced with 5-methylcytosine for increased triplex  
CC stability. The present sequence is used in the assay of the invention,  
CC where it can be part of the anchor DNA or reporter DNA sequence. The  
CC assay comprises adding a sample containing double-stranded DNA test  
CC sequences to an aqueous medium containing at least one complex of anchor  
CC DNA, attached to a solid support, and reporter DNA, where either a part  
CC of the anchor DNA or reporter DNA is designed to form a triple-strand  
CC structure with part of the test sequence. Triplex formation results in  
CC displacement of the reporter DNA which is detected as an indication of  
CC the presence of the DNA test sequence. The method is used to detect DNA  
CC sequences, particularly for identification of bacteria (by detecting  
CC genes for ribosomal RNA) in clinical samples, but also detection of  
CC oncogenes and Hepatitis B virus

PT acid sequences.  
PT  
XX Example 1; Page 40; 46pp; English.  
PS  
XX This invention describes a novel method for the visual detection of  
CC target nucleic acid presence in a sample. A preferred target is a  
CC Mycobacterium complex nucleic acid sequence. The detection method uses  
CC visual detection of a change in the hybridization without aid of  
CC instrumentation. Multiple copies of a target nucleic acid sequence are  
CC mixed with first and second detectable probes under hybridizing  
CC conditions favouring particle agglutination via a bridging molecule  
CC allowing for visual detection of the target nucleic acid sequence. The  
CC bridging molecule enhances or inhibits formation of a hybridization  
CC complex

Light-responsive oligonucleotides, useful in controlling DNA synthesis
PT and gene expression, have structural isomerization on irradiation, and
PT reversible change in melting temperature of the formed double or triple
PT strands.
XX
Example 3; Page 20; 43pp; Japanese.
XX
The present invention relates to light responsive oligonucleotide, which
CC contain one or more organic groups which can undergo structural
CC isomerisation upon irradiation at a specific wavelength. The melting
CC temperature of a double-strand formed by the light-responsive
CC oligonucleotide, and another oligonucleotide complementary to the light-
CC responsive oligonucleotide, reversibly changes depending on light
CC irradiation. The oligonucleotides are useful in biotechnology, e.g. in
CC controlling DNA elongation, gene expression, amplification and
CC transcription, and for efficient gene diagnosis and gene therapy. The
CC present sequence is an oligonucleotide used in the present invention

Oligomers comprising L-ribo-Locked Nucleic Acid (LNA) nucleosides, useful
PT for therapeutic purposes e.g. in the construction of oligonucleotides, as
PT substrates for nucleic acids polymerases and in RNA mediated catalytic
PT processes.
XX
Example 11; Page 56; 79pp; English.
XX
The present invention relates to an oligomer comprising L-ribo-
CC configurated Locked Nucleoside Analogues (L-ribo-LNA analogues). The
CC present sequence is an RNA oligonucleotide. Binding studies of the L-ribo
CC -LNA analogues towards the present sequence were carried out, to
CC determine the thermostability of the L-ribo-LNA analogues. The analogs of
CC the present invention have a variety of uses e.g. in the preparation of
CC conjugates of the L-ribo-LNA modified oligonucleotides (oligomers)

XX  
CC The present invention relates to retinoid (e.g., retinoic acid (RA),  
CC vitamin A) metabolising proteins and nucleic acid sequences encoding  
CC them. RA metabolising proteins contain a haeme-binding motif which is  
CC characteristic of the group of proteins known as cytochrome P450s. The  
CC sequences of the invention are useful in retinoid metabolism and in  
CC producing retinoic acid metabolising cytochrome P450s. They are  
CC particularly useful as targets for the treatment of certain cancers such  
CC as prostate cancer. The invention also relates to a method of screening  
CC drugs for their effect on activity of RA inducible proteins. The present  
CC DNA sequence is poly(T) PCR primer which is used for isolating retinoid  
CC regulating genes by differential display of mRNAs

XX CC Identifying a candidate polymorphic repeat within a coding sequence, for
XX CC understanding or treating genetic disease, comprises detecting tandem
XX CC repeats in a target coding sequence and scoring the repeats for
XX CC polymorphic probability.
XX PS Example; Col 343; 588pp; English.
XX CC The invention discloses a method for identifying a candidate polymorphic
XX CC repeat within a coding sequence (expressed sequence tag, EST), which
XX CC comprises detecting tandem repeats in a target coding sequence, scoring
XX CC the repeats for polymorphic probability and generating a dataset
XX CC correlating the repeats with polymorphic probability to identify a
XX CC candidate polymorphic repeat. The computational methods (polymorphic
XX CC marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are
XX CC useful for identifying and detecting candidate polymorphic repeats in
XX CC human genes, which can be used to understand, treat or eliminate genetic
XX CC diseases, predispositions or adverse drug-treatment reactions. Examples
XX CC of diseases linked to nucleotide repeats are Machado-Joseph, Haw River
XX CC syndrome, Huntington's disease, fragile-X syndrome, Friedrich's ataxia,
XX CC myotonic dystrophy, hyperandrogenaemia, spinal and bulbar atrophy and
XX CC spinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are
XX CC the polymorphic repeats identified for a search of human ESTs

 XX Amplifying target DNA by polymerase chain reaction, useful in  
 PT pharmacogenomics, comprises mixing the target DNA, a set of single-  
 PT stranded oligonucleotide primers, a DNA polymerase, and multiple  
 PT deoxynucleoside triphosphates.  
 XX Example 1; SEQ ID NO 16; 46pp; English.  
 XX The present sequence is that of a binding site for universal-tagged  
 CC specific primers ADF82924-ADF82929 in a template DNA sequence ADF82930  
 CC used in an example from the invention. Experiments were performed to  
 CC determine whether locked nucleic acid (LNA) substitution of bases in

CC universal-tagged specific primers had an effect on the efficiency of PCR  
 CC amplification. Real-time analysis was performed on 5'-nuclease assay PCR  
 CC reactions using the template, 5'-nuclease forward and reverse primers, a  
 CC 5'-nuclease probe and the universal-tagged primers, specifically designed  
 CC to have homology with the template and to contain a base substitution  
 CC with 0, 1, 2, 3 or 5 LNA bases. Cycle threshold values indicated that the  
 CC higher melting temperatures provided by substitution with LNA bases did  
 CC not correlate with greater efficiency in PCR amplification. The invention  
 CC relates to the use of universal-tagged primers for amplification of DNA,  
 CC especially human genomic DNA, optionally including single nucleotide  
 CC polymorphism (SNP) genotyping. The primers may include LNA bases.

 XX Amplifying for RNA in a sample, useful for improving RNA polymerase based  
 PT RNA transcription from a polynucleotide template, comprises eliminating  
 PT single-stranded oligonucleotide from the transcription sample.  
 XX Example 1; SEQ ID NO 4; 26pp; English.  
 XX The invention relates to amplifying for RNA in a sample comprises  
 CC eliminating single-stranded oligonucleotide from the transcription  
 CC sample. The method involves synthesizing single-stranded cDNA by  
 CC incubating the sample RNA with reverse transcriptase and an  
 CC oligonucleotide primer that primes synthesis in a direction toward 5' end  
 CC of the RNA; converting the single-stranded cDNA into double-stranded cDNA  
 CC to form a transcription sample containing a cDNA template; eliminating  
 CC single-stranded oligonucleotide from the transcription sample; and  
 CC transcribing the cDNA template into RNA using an RNA polymerase. The  
 CC method is useful for improving RNA polymerase based RNA transcription  
 CC from a polynucleotide template. The method inhibits the undesired non-  
 CC template derived production of RNA in the transcription reaction.  
 CC Sequences ADI34483-ADI34489 represent oligonucleotides used in a T7 RNA  
 CC transcription reaction.

 XX Typing genes that contain polymorphic microsatellite loci, useful for  
 PT identifying predisposition to disease, by amplification and determining  
 PT length of amplicons.  
 XX  
 XX Example 3; Page 31; 64pp; German.

The invention describes a method of typing (M1) a gene (I) that has one  
 or more polymorphic microsatellite loci (PML). The method comprises: PCR  
 amplification of at least one DNA region of (I) that includes PML, using  
 as template a DNA sample containing at least one segment of (I); and  
 determining the length of the resulting amplicon(s). Also described are:  
 a method of determining (M2) microsatellite markers (MM) for  
 predisposition to a disease, associated with a gene that includes one or  
 more PML; and prediagnosis (M3) of diseases associated with gene that  
 include PML. The method is used to identify microsatellite markers, in a  
 disease-related gene, that are associated with a predisposition to  
 diseases and for prediagnosis of such diseases, especially prion diseases  
 but also cystic fibrosis, malignant hyperthermia syndrome in pigs and  
 metabolic diseases; also to type genes that encode milk proteins,  
 hormones or transcription factors. The method is simpler, quicker and  
 particularly less expensive than known methods based on sequencing. This  
 sequence represents a primer used to genotype a region of the sheep prion  
 protein (PrP) comprising a polymorphic microsatellite locus.

 CC The present sequence represents a preferred target sequence for an  
 CC enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA at the  
 CC nucleotide base position indicated in the DE line. Regions of the mRNA  
 CC that do not form secondary folding structures and that contain potential  
 CC hammerhead and hairpin ribozyme cleavage sites were identified by  
 CC computer analysis. Ribozymes directed against these mRNA sequences were  
 CC designed and synthesised with modifications that improve their nuclease  
 CC resistance. The ribozymes cleave the ICAM-1 target sequences and thereby  
 CC inhibit ICAM-1 expression, making them useful for reducing transplant  
 CC rejection and alleviating symptoms in patients with rheumatoid arthritis,  
 CC asthma and other inflammatory disorders. (Updated on 25-MAR-2003 to

XX  
XX This sequence represents a primer of the invention. The invention relates  
CC to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta  
CC -N3'; or (X)m5'-(gamma)k-delta-N3'; where X = a labelled compound and/or  
CC a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n =  
CC natural number indicating the repetition of alpha; beta, delta = V or N;  
CC V = adenine, guanine or cytosine; N = adenine, guanine, cytosine or  
CC thymine; gamma = thymine; k = natural number of 3 or over indicating the  
CC repetition of gamma, in which thymine expressed by gamma is composed of  
CC 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are  
CC useful as primers for RT-PCR and determination of base sequences. The new  
CC sequences allow for reproductive and highly efficient analysis of gene

PT metastatic potential comprises determining the levels of macrophage
PT migration inhibitory factor within tumor cells.
XX
PS Claim 11; Col 7-8; 6pp; English.
XX
CC This invention describes a novel method for diagnosing adenocarcinoma and
CC determining metastatic ability of human cancer in an individual by
CC determining the increased levels of macrophage migration inhibitory
CC factor (MIF) within tumor cells. The method is useful for diagnosing
CC human adenocarcinoma, as well as for its prognosis. The method is also
CC useful for measuring levels of macrophage migration inhibitory factor
CC within tumor cells. The method provides better and more accurate
CC prognostic markers for cancer. The method is also capable of
CC distinguishing histological tumors from clinical cancers. This sequence
CC represents a primer used to detect the human MIF gene D5k region which is
CC described in the method of the invention

PT Treating gastric acid disturbance by administering an oligonucleotide
PT which modulates the activity of a polypeptide involved in gastric acid
PT production or secretion.
XX
PS Example 3; Page 148; 164pp; English.
XX
CC The present invention provides oligonucleotides, and methods for their
CC use, which are useful in modulating the action of proteins involved in
CC gastric acid production. The target protein is preferably the histamine
CC H2 receptor or one of the proteins which form part of the gastric proton
CC pump. The sequences and methods of the invention are useful in the
CC treatment of gastric reflux, gastritis, dyspepsia, stomach ulcers,
CC duodenal ulcers and other gastric acid disturbances, most of which are
CC caused by Helicobacter pylori

PT Synthesizing branched nucleic acids useful as diagnostic and molecular  
 PT probes, involves combining first units having haloalkylamino groups and  
 XX second units having thiol or phosphorothioate groups.  
 XX  
 XX Example 5; Col 17-18; 20pp; English.  
 XX  
 XX The present invention relates to a method for synthesising a branched or  
 CC multiply connected macromolecular structure, comprising oligonucleotide  
 CC clamps (OC). The macromolecular structure is capable of specifically  
 CC binding to a target molecule, and can therefore be used as probes. At  
 CC least one OC comprises a target binding sequence that binds specifically  
 CC and stably with the target molecule, and at least two OCs comprise signal  
 CC generation moieties capable of generating a detectable signal in the  
 CC presence of the target molecule. In addition the OCs are connected to one  
 CC another by thioalkylamino, or thiophosphorylalkylamino bridges. The  
 CC present sequence is an OC used in the present invention

 PT A triple-helix comprising a double helical nucleic acid (DHNA) and an  
 PT oligonucleotide which binds in parallel and antiparallel orientation,  
 PT respectively, for targeting sequences on alternate strands of DHNA to  
 PT control gene expression.  
 XX  
 PS Example 7; Fig 24A; 108pp; English.  
 XX

CC The present invention relates to methods and oligonucleotides for forming  
 CC a triple-helix comprising a double helical nucleic acid comprising first  
 CC and second substantially complementary strands, and an oligonucleotide

bound to a purine-rich target sequence within the double helical nucleic acid, where the oligonucleotide binds in a parallel and antiparallel orientation, respectively, to target sequences on alternate strands of the double helical nucleic acid. The method has therapeutic applications, where gene expression is controlled by selective triple-helix formation within expression regulatory sequences of a target gene. The oligonucleotides can be used to form triple-helices, and are useful to detect the presence or absence of specific sequences within genomic DNA for diagnostic and therapeutic purposes. The oligonucleotides can be selected to specifically bind to pathogenic double-stranded DNA including specific sequences required by pathogenic bacteria or viruses for replication or virulence, reducing their pathogenicity. Alternatively, the oligonucleotide can be chosen to target a unique sequence of the pathogen which is not found in the genome of pathogen's host. The oligonucleotides can be used in cancer treatment by way of triple-helix suppression of specific oncogenes including those of endogenous or viral origin. Such therapeutic oligonucleotides are capable of forming triple-helices with such sequences in cancerous cells containing the activated oncogene, so preferentially killing or repressing the cancer causing cell. The present sequence represents an oligonucleotide used in the methods of the present invention

Identifying a candidate polymorphic repeat within a coding sequence, for understanding or treating genetic disease, comprises detecting tandem repeats in a target coding sequence and scoring the repeats for polymorphic probability.

Example; Col 747; 588pp; English.

The invention discloses a method for identifying a candidate polymorphic repeat within a coding sequence (expressed sequence tag, EST), which comprises detecting tandem repeats in a target coding sequence, scoring the repeats for polymorphic probability and generating a dataset correlating the repeats with polymorphic probability to identify a candidate polymorphic repeat. The computational methods (polymorphic marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are useful for identifying and detecting candidate polymorphic repeats in human genes, which can be used to understand, treat or eliminate genetic diseases, predispositions or adverse drug-treatment reactions. Examples of diseases linked to nucleotide repeats are Machado-Joseph, Haw River syndrome, Huntington's disease, fragile-X syndrome, Friedrich's ataxia, myotonic dystrophy, hyperandrogenaemia, spinal and bulbar atrophy and spinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are the polymorphic repeats identified for a search of human ESTs

Generating nucleic acid having reduced ability to hybridize for use in molecular biology, comprises providing nucleotide triphosphates to synthesize nucleic acid complementary to a template nucleic acid.

Example 9; SEQ ID NO 33; 74pp; English.

The present invention provides a system for the production of nucleic acids with reduced levels of intramolecular base pairing (secondary structure) and intermolecular base pairing by generating unstructured nucleic acids (UNAs). The invention is useful for generating nucleic acid having a reduced ability to hybridise. The invention is also useful in molecular biology and nucleic acid chemistry. The present sequence is poly T primer used to synthesise full-length unstructured nucleic acid

PS
XX
XX The present invention describes nucleic acids (A) that interact stably
CC with a target sequence and contain at least one phosphorodithioate
CC link, having endonuclease activity. (A), and more generally any catalytic
CC nucleic acid (A') that modulates expression of the oestrogen receptor
CC gene, are used to treat cancer (particularly of breast or endometrium),
CC in vivo or by transforming cells ex vivo and implanting treated cells, or
CC for other conditions associated with levels of oestrogen receptor.
CC Because of the high selectivity for targeted RNA, (A) can also be used to
CC correlate inhibition of gene expression with alterations in phenotype,
CC particularly for identification of therapeutic targets, and as research
CC reagents (for RNA, in the same way that restriction endonucleases are
CC used with DNA). The combination of modifications in (A) improves
CC resistance to nucleases, binding affinity and/or activity. AAA23503 to
CC AAA24747 represent oestrogen receptor hammerhead ribozyme sequences, and
CC AAA24748 to AAA25992 represent their corresponding target sequences.
CC AAA25993 to AAA26105 represent oestrogen receptor hairpin ribozyme
CC sequences, and AAA26107 to AAA26218 represent their corresponding target
CC sequences. AAA26219 to AAA26271 represent other ribozyme sequences and
CC antisense oligonucleotides used in the exemplification of the present
CC invention

XX This invention relates to novel isolated nucleic acid sequences involved

CC in the phenomena of tumour suppression, tumour reversion, apoptosis

CC and/or resistance to viruses. The invention may be useful for the

CC development of compounds with a cytostatic, virucide, neuroprotective,

CC neurotropic or neuroleptic activity. The DNA sequences may be useful as

CC probes and primers for detecting, identifying, quantifying and/or

CC amplifying nucleic acid, for example as one component of a gene chip, in

CC vitro as antisense reagents and for production of recombinant

CC polypeptides. The invention may therefore be useful for preparation of

CC pharmaceuticals for prevention and/or treatment of viral diseases that

CC are characterised by development of tumours or cell degeneration,

CC specifically cancer but also Alzheimer's disease and schizophrenia. The

CC present sequence is that of a nucleic acid sequence of the invention.

CC Note: The sequence data for this patent did not form part of the printed

CC specification, but was obtained in electronic format directly from WIPO

CC at ftp.wipo.int/pub/publishedpct\_sequences

DR Enzymatic nucleic acid molecules which specifically cleave RNA derived

PT from hepatitis C virus (HCV) useful for the treatment of HCV infections,

PT especially in combination with type I interferon therapy.

PT

XX Claim 1; SEQ ID NO 1541; 19pp; English.

PS

XX The invention relates to an enzymatic nucleic acid molecule which

CC specifically cleaves RNA derived from hepatitis C virus (HCV), in which

CC the binding arms of the enzymatic nucleic acid molecule comprises

CC sequences complementary to any of the defined substrate sequences given

CC in the specification. The nucleic acid molecule may be administered for

CC the treatment of HCV infections, especially in combination with type I

CC interferons. The present sequence represents a HCV DNzyme substrate

CC sequence.

DR Identifying a cell with a desired oligonucleotide-directed sequence

PT alteration at a nucleic acid target site within the cell by identifying

PT the desired sequence alteration in cells selected for the presence of a

PT selectable phenotype.

PT

XX Example 25; SEQ ID NO 955; 303pp; English.

PS

XX This invention relates to a novel method of identifying a cell having a

CC desired oligonucleotide-directed sequence alteration at a first nucleic

CC acid target site within the cell. The method comprises identifying the

CC desired sequence alteration in cells that have been selected for the

CC presence of a selectable phenotype conferred by a concurrent

CC oligonucleotide-directed sequence alteration at a second nucleic acid

CC target site within the cells. The method is useful in identifying a cell

CC having a desired oligonucleotide-directed sequence alteration at a first

CC nucleic acid target site within the cell. The method may be useful for

CC the production of plants with herbicide resistance, male or female

CC sterile plants, abiotic stress tolerance, albino plants or plants with

CC altered amino acid production as well as for use in mammalian cell lines.

CC The present sequence is that of a mutagenic oligonucleotide which was

CC used in the exemplification of the invention.

XX
CC The 3' end of this oligonucleotide carries 1,3-propanediol. The oligo is
CC one of four oligonucleotides which were designed to specifically bind and
CC cross-link to the duplex target sequence AAQ20004. Oligo #2 has the
CC covalent cross-linking group, i.e. N4N4-ethanocytosine, at its 3' end. An
CC assay for crosslinked triple helix showed considerable reaction with
CC Oligo #2 and with Oligo #1 (see AAQ20005) which has the crosslinking
CC group at the 5' end. The most complete reaction was seen with Oligo #3
CC (see AAQ20007) having N4N4-ethanocytosine at both the 5' and 3' termini.
CC A control oligo with no cross-linking group showed no reaction. The half-
CC life of the cross-linking reaction for Oligo #2 was ca. 1 hr (1 microm);
CC Oligo #1 showed a rate four times slower. See also AAQ20008

XX PT New anti-sense hepatitis C virus oligo:nucleotide(s) - used for  
PT inhibiting HCV RNA translation, for the treatment or prevention of HCV  
PT infection.  
XX PS Claim 1; Page 31; 50pp; English.  
XX CC The present oligonucleotide (ON) inhibits the expression of hepatitis C  
CC virus (HCV) RNA, specifically HCV type II protein synthesis is inhibited  
CC by about 50%. The ONs of the invention inhibit translation of HCV types I  
CC -V RNA in vivo, ex vivo or in vitro, and can therefore be used to treat  
CC or prevent HCV infection. The antisense ONs comprise 10-28 nucleotides  
CC complementary to the entire HCV 5'-non-coding and part of the core  
CC region. The A or S in the ONs name denotes antisense or sense, and the  
CC no. indicates the position of the 5'-end of the ON. The ON was tested at  
CC 10 fold molar excess to HCV RNA

 XX  
 CC A method has been developed of separating and detecting tagged  
 CC polynucleotides. The method comprises: providing a set of  
 CC polynucleotides, each tagged with a chromatophore or fluorophore; resolving  
 CC to separate one of the tagged polynucleotides from other tagged  
 CC polynucleotides differing in length by a single nucleotide using an  
 CC electrophoretic procedure capable of resolving tagged polynucleotides  
 CC differing by a single nucleotide; and detecting the resolved tagged  
 CC polynucleotides by means of the chromatophore or fluorophore. The present  
 CC invention also describes a method of determining the sequence of a  
 CC polynucleotide by analyzing tagged polynucleotide fragments generated by  
 CC a polynucleotide sequencing technique which comprises: introducing the  
 CC tagged polynucleotide fragments into an electrophoretic medium;  
 CC separating the tagged polynucleotide fragments in the electrophoretic  
 CC medium using an electrophoretic procedure capable of resolving the  
 CC polynucleotide fragments differing in length by a single nucleotide;  
 CC detecting the separated tagged polynucleotide fragments by means of the  
 CC chromatophore or fluorophore; and determining the polynucleotide sequence  
 CC from the polynucleotide fragments detected. The present sequence  
 CC represents a DNA fragment used in an example for end-labeling the DNA  
 CC fragment with a fluorescent tag

 XX  
 PS Claim 12; Page 8-24; 47pp; English.  
 XX  
 CC Sequences AAV46501-V47446 are anti-sense oligonucleotides that target the  
 CC human adenosine A1 receptor, the design of which required the secondary  
 CC structure of this targets mRNA. The adenosine receptor mRNA secondary  
 CC structure was both analysed and used to construct antisense  
 CC oligonucleotides containing a phosphorothioate backbone. Once the  
 CC antisense molecules are created they can be used to target their  
 CC predetermined target, thus causing the gene product to decrease. The  
 CC antisense oligonucleotides were targeted to specific mRNA regions  
 CC containing either a junction between the intron and exon, or where they  
 CC may overlap the initiation codon. The receptor is a member of the G-  
 CC protein coupled family of cell surface receptors that have 7-  
 CC transmembrane segments. These oligonucleotides can be used to treat or  
 CC prevent conditions associated with bronchoconstriction and/or lung  
 CC inflammation in humans or other animals e.g. asthma, pulmonary disease,  
 CC allergy, emphysema and cystic fibrosis

DR Identifying new catalytic nucleic acid that modulates selected processes  
 XX - especially ribozymes that cleave Raf RNA for treating cancer,  
 PT restenosis, and also new ribozymes and modified nucleoside triphosphates  
 PT used as antiviral agents and synthons.

XX Claim 177; Page 162; 259pp; English.

PS A method has been developed for the identification of a nucleic acid  
 CC capable of modulating a process in a biological system. The method  
 CC comprises: (a) introducing into the system a random library of nucleic  
 CC acid catalysts (NAC) having a substrate binding domain (SBD), comprising  
 CC a random sequence, and a catalytic domain (CD); and (b) identifying NAC  
 CC in systems where modulation has occurred and/or determining the sequence  
 CC of at least part of the SBDs in such systems. Nucleic acid molecules with  
 CC endonuclease activity and catalytic activity, from the present invention,  
 CC are used to modulate gene expression in plant and mammalian cells and to  
 CC cleave target nucleic acid, particularly for treating systemic diseases  
 CC caused by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepatic  
 CC ascites and infection. They may also be used to detect genetic drift and  
 CC mutations in diseased cells and to determine c-raf RNA. Specifically NACs  
 CC with RNA-cleaving activity that modulate expression of the Raf gene, are  
 CC used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or  
 CC generally any condition associated with the level of c-raf. Introduction  
 CC of sugar/phosphate modifications increases stability against nuclease and  
 CC activity. AAV90922 to AAV93877 represent NACs that can be used in the  
 CC method, specifically for modulating the expression of a Raf gene

DR New antisense oligonucleotides used in treatment of, e.g. pulmonary  
 PT vasoconstriction.

XX Disclosure; Page 41; 120pp; English.

PS The specification describes antisense oligonucleotides (AAX52869-X55271)  
 CC directed against at least 2 mRNAs selected from target genes, coding and  
 CC non-coding regions of RNAs corresponding to target genes, gene initiation  
 CC codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'-  
 CC end and the juxta-section between coding and non-coding regions and all  
 CC segments of RNAs encoding proteins associated with one or more diseases,  
 CC from sequences AAX55272-74. These multiple target oligonucleotides  
 CC (specifically AAX55180-271) can be used for the antisense treatment of  
 CC diseases and conditions. Typical diseases and conditions are those  
 CC associated with impaired respiration and inflammation, including lung  
 CC diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,  
 CC acute asthma, allergies, asthma, impeded respiration, respiratory  
 CC distress syndrome, pain, cystic fibrosis, pulmonary hypertension,  
 CC pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary  
 CC disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g.  
 CC colon cancer, breast cancer, lung cancer, pancreatic cancer,  
 CC hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastases, as  
 CC well as all types of cancers which may metastasize or have metastasized  
 CC to the lungs, including breast and prostate cancer

CC This sequence is an antisense oligonucleotide that hybridises to  
CC Hepatitis C virus (HCV) RNA, under physiological conditions. The  
CC invention relates to HCV antisense oligonucleotides, and also for a  
CC vector comprising a nucleotide sequence which is transcribed in an animal  
CC cell to generate an antisense oligonucleotide. The oligonucleotides have  
CC virucide, hepatotropic and anti-inflammatory activity, and are useful for  
CC treating HCV infection by inhibiting translation of type 1-V HCV RNA.  
CC Hepatitis C virus is a positive strand RNA virus, and is the major  
CC causative agent of post-transfusion hepatitis. Persistent HCV infection  
CC can lead to chronic hepatitis, cirrhosis, and hepatocellular carcinoma

 XX PT Novel composition for treating or preventing e.g. cardiopulmonary and renal injury.  
 XX PS Claim 17; Page 36; 252pp; English.  
 XX CC The present invention describes a pharmaceutical composition, comprising at least one agent (I) that prevents, alleviates and/or inhibits adenosine-mediated cardiopulmonary and/or renal damage and/or failure. (I) is an adenosine A2a receptor agonist (Ia), or an oligonucleotide (Ib), containing less than 15% adenosine (A), that is antisense to target genes or corresponding RNA, to genomic flanking regions (i.e. 5' or 3' ends or segments between coding and non-coding sequences), or to all segments of mRNA encoding the adenosine A1, A2a, A2b or A3 receptors, and has A1, A2b or A3 agonist activity at this receptor). (I) may be a mixture of (Ia) and (Ib), and optionally also contains one or more surfactants. The compositions are used to prevent, alleviate and/or treat adenosine receptor-mediated cardiac, lung and/or renal damage or failure (particularly where associated with ischaemia, toxin release and/or administration of drugs or imaging agents, e.g. adenosine for treating supraventricular tachycardia); (adult) respiratory distress syndrome (e.g. associated with sepsis); allergic rhinitis; chronic obstructive pulmonary disease; cardiopulmonary hypoxia associated with administration of stress-test agents, particularly where such conditions are associated with acute inflammation. AAA02717, AAA02719, AAA02721 and AAA02723 to AAA03715 represent specifically claimed phosphorothioate antisense oligonucleotides for use in the composition of the present invention. AAA02718, AAA02720, AAA02722 and AAA03716 to AAA03720 represent other phosphorothioate oligonucleotides used in the exemplification of the present invention

XX New nucleic acids that interact, and optionally cleave, target sequences,  
 PT used to treat cancer.

XX Claim 77; Page 79; 148pp; English.

XX The present invention describes nucleic acids (A) that interact stably

CC with a target sequence and contain at least one phosphoro(di)thioate  
 CC link, having endonuclease activity. (A), and more generally any catalytic  
 CC nucleic acid (A') that modulates expression of the oestrogen receptor  
 CC gene, are used to treat cancer (particularly of breast or endometrium),  
 CC in vivo or by transforming cells ex vivo and implanting treated cells, or  
 CC for other conditions associated with levels of oestrogen receptor.  
 CC Because of the high selectivity for targeted RNA, (A) can also be used to  
 CC correlate inhibition of gene expression with alterations in phenotype,  
 CC particularly for identification of therapeutic targets, and as research  
 CC reagents (for RNA, in the same way that restriction endonucleases are  
 CC used with DNA). The combination of modifications in (A) improves  
 CC resistance to nucleases, binding affinity and/or activity. AAA23503 to

XX Enzymatic and antisense nucleic acid inhibition of repressor genes,  
 PT useful for producing e.g. granulocyte colony stimulating factor protein,  
 PT interferon alpha and erythropoietin.

PS Claim 37; Page 77; 164pp; English.

CC The present invention relates to enzymatic and antisense nucleic acid  
 CC molecules that act as inhibitors of the expression of repressor genes  
 CC encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription  
 CC factor gene, IRF-2 and/or the CAAT Displacement Protein (CDP).  
 CC Inhibition of the repressors removes prevents inhibition (and  
 CC consequently increases expression of) genes involved in the production of  
 CC erythropoietin, granulocyte colony stimulating factor protein and  
 CC interferon alpha

XX Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense  
PT constructs, which down regulate expression of a CD20 gene or neurite  
PT growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and  
PT central nervous system injury.  
XX  
PS Claim 88; Page 99; 200pp; English.

XX The invention relates to a nucleic acid molecule which down regulates  
CC expression of a CD20 gene and a nucleic acid molecule which down  
CC regulates expression of a neurite growth inhibitor gene (NOGO). The  
CC nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a  
CC DNazyme) an inozyme (an endolytic nucleic acid cleaving an RNA molecule  
CC possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) or  
CC an amberzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA  
CC with a YGY motif). The CD20-targeting nucleic acid is used to cleave RNA  
CC of CD20 in the presence of a divalent cation that is preferably Mg<sup>2+</sup>.  
CC Furthermore, it may be contacted with a cell to reduce CD20 activity of  
CC the cell and treat a patient having a condition associated with the level  
CC of CD20. The treatment may further comprise the use of one or more  
CC therapies. In particular, the CD20 targeting nucleic acid may be used to  
CC treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-  
CC Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic  
CC leukaemia, HIV (human immunodeficiency virus) associated NHL, lymphocytic  
CC immune thrombocytopaenia, and inflammatory arthropathy. The NOGO-  
CC targeting nucleic acid is used to cleave RNA of the NOGO gene in the  
CC presence of a divalent cation that is preferably Mg<sup>2+</sup>. Furthermore, the  
CC nucleic acid may be contacted with a cell to reduce NOGO activity of the  
CC cell and treat a patient having a condition associated with the level of  
CC NOGO. The treatment may further comprise the use of one or more  
CC therapies. In particular, the NOGO-targeting nucleic acid may be used to  
CC treat central nervous system (CNS) injury and cerebrovascular accident  
CC (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS),  
CC chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS),  
CC Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob  
CC disease, muscular dystrophy, and/or other neurodegenerative disease  
CC states which respond to the modulation of NOGO expression. The present  
CC sequence is a zinzyme molecule of the invention

 XX PT Identifying candidate therapeutic agents for treating body weight  
 PT disorders, comprises contacting test compound with cell expressing  
 PT mammalian obese receptor and reporter protein, and measuring expression  
 PT of reporter protein.  
 XX Example; Col 119; 110pp; English.  
 XX The present invention relates to novel obese (Ob) receptor (ObR) proteins  
 CC and polynucleotides encoding them. The invention relates to a method of  
 CC identifying candidate therapeutic agents to treat body weight disorder.  
 CC The method involves providing a cell which expresses a mammalian ObR on  
 CC the cell surface, binds leptin, the cell harbouring a reporter construct  
 CC comprising a sequence encoding a reporter protein, contacting the cell  
 CC with a test compound and measuring the expression of the reporter protein  
 CC in the presence of the test compound. The method is useful to identify an  
 CC agent, preferably a small molecule or antibody for the treatment of body  
 CC weight disorders such as obesity, cachexia, and anorexia. The present DNA  
 CC sequence is a PCR primer which is used for amplifying mouse ObR genomic  
 CC DNA. This sequence is used in the exemplification of the invention

XX
XX New polypeptide, for raising antibodies that recognize hGDMPLP-1 proteins,
XX or as specific biomolecule capture probes for surface-enhanced laser
XX desorption ionization, comprises human myosin-like protein hGDMPLP-1.
XX
XX Disclosure; SEQ ID NO 1895; 214pp; English.
XX
XX The present invention describes a human genome-derived myosin-like
XX protein 1 (hGDMPLP-1). The protein and polynucleotide sequences of hGDMPLP-
XX 1 can be used in gene therapy and vaccine production. The hGDMPLP-1
XX nucleic acids can be used as probes to detect, characterise and quantify
XX hGDMPLP-1 nucleic acids in samples, as amplification substrates, to
XX provide initial substrates for the recombinant engineering of hGDMPLP-1
XX protein variants having desired phenotypic improvements, and for
XX expressing the proteins. The hGDMPLP-1 proteins or polypeptides may be
XX used as immunogens to raise antibodies that specifically recognise hGDMPLP
XX -1 proteins, as standards in assays used to determine the concentration
XX and/or amount specifically of hGDMPLP proteins, as specific biomolecule
XX capture probes for surface-enhanced laser desorption ionisation, as
XX therapeutic supplement in patients having specific deficiency in hGDMPLP-1
XX production, and in vaccines or for replacement therapy. The
XX polynucleotide sequences encoding hGDMPLP-1 may be used for diagnosing a
XX disorder associated with the expression of hGDMPLP-1, in particular heart
XX and skeletal muscle disorders. hGDMPLP-1 is localised to chromosome 22.
XX The present sequence represents an oligomer used in the screening of the
XX hGDMPLP-1 sequence in the exemplification of the present invention. N.B.
XX The sequence data for this patent did not form part of the printed
XX specification, but was obtained in electronic format directly from WIPO

XX protein 1 (hGDMPLP-1). The protein and polynucleotide sequences of hGDMPLP-
XX 1 can be used in gene therapy and vaccine production. The hGDMPLP-1
XX nucleic acids can be used as probes to detect, characterise and quantify
XX hGDMPLP-1 nucleic acids in samples, as amplification substrates, to
XX provide initial substrates for the recombinant engineering of hGDMPLP-1
XX protein variants having desired phenotypic improvements, and for
XX expressing the proteins. The hGDMPLP-1 proteins or polypeptides may be
XX used as immunogens to raise antibodies that specifically recognise hGDMPLP
XX -1 proteins, as standards in assays used to determine the concentration
XX and/or amount specifically of hGDMPLP proteins, as specific biomolecule
XX capture probes for surface-enhanced laser desorption ionisation, as
XX therapeutic supplement in patients having specific deficiency in hGDMPLP-1
XX production, and in vaccines or for replacement therapy. The
XX polynucleotide sequences encoding hGDMPLP-1 may be used for diagnosing a
XX disorder associated with the expression of hGDMPLP-1, in particular heart
XX and skeletal muscle disorders. hGDMPLP-1 is localised to chromosome 22.
XX The present sequence represents an oligomer used in the screening of the
XX hGDMPLP-1 sequence in the exemplification of the present invention. N.B.
XX The sequence data for this patent did not form part of the printed
XX specification, but was obtained in electronic format directly from WIPO
XX at ftp.wipo.int/pub/published_pct_sequence

PT New human kidney tumor overexpressed membrane (KTOM1) protein and nucleic  
PT acids encoding the protein, useful for treating subjects having defects  
PT in KTOM1 which can manifest as cancer of the kidney, or as a disorder of  
PT e.g., liver or bone.

XX Example 2; Page 216; 418pp; English.

XX The invention relates to a novel isolated nucleic acid encoding human  
CC KTOM1 (kidney tumour overexpressed membrane) protein. The protein of the  
CC invention has cytotostatic activity. The nucleotide may have a use in gene  
CC therapy. The KTOM1 nucleic acids may be used to diagnose, treat or  
CC monitor a disease caused by altered expression of human KTOM1.  
CC Compositions comprising the nucleic acids, proteins or antibodies may be  
CC used to treat subjects having defects in KTOM1 which can manifest as  
CC cancer of the kidney, as well as a disorder of liver, bone marrow, brain,  
CC heart, lung, kidney, colon, skeletal muscle, testis, uterus and placenta  
CC function. The sequence represents a probe used in the invention to scan  
CC the nt 1-1001 portion of human KTOM1a (ABQ63232)

XX Novel isolated human testis expressed Patched like protein (HTPL), useful  
PT for identifying agonist and antagonist and specific binding partners, and  
PT for treating subjects having defects in HTPL.  
XX Example 2; Page 226; 718pp; English.  
XX The present invention relates to human testis expressed Patched like  
CC protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL  
CC has two isoforms, with a few single base pair differences between the  
CC two. One of the single base pair changes introduces a premature stop  
CC codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL  
CC shares an overall structure organisation with the Patched protein. The  
CC shared structural features strongly imply that HTPL plays a role similar  
CC to that of Patched, and is a potential tumour suppressor. HTPL is  
CC important in regulating male germ cell development, and the HTPL gene was  
CC mapped to human chromosome 10p12.1. HTPL and its coding sequence are  
CC useful for diagnosing a disorder caused by mutation in HTPL, and in  
CC therapy and manufacture of a medicament for treatment or prevention of  
CC such disorder associated with decreased expression or activity of human  
CC HTPL. Such disorders include disorders of testis, or adrenal, adult and  
CC foetal liver, bone marrow, brain, kidney, lung, placenta, prostate,  
CC skeletal muscle or colon function. HTPL proteins and nucleic acids are  
CC clinically useful diagnostic markers and potential therapeutic agents for  
CC male infertility and cancer. The present oligonucleotide was used in an  
CC example from the invention

 XX  
 XX Novel polynucleotide which down regulates expression of Ets-related gene,  
 PT useful for treating cancer, diabetic retinopathy, macular degeneration,  
 PT arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.  
 XX  
 PS Claim 4; Page 74; 149pp; English.  
 XX  
 XX The invention relates to a nucleic acid molecule (I) which down regulates  
 CC expression of an Ets-related gene (ERG). (I) is useful for treating  
 CC conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma,  
 CC tumour angiogenesis, diabetic retinopathy, macular degeneration,  
 CC neovascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca  
 CC vulgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge  
 CC Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-rendu  
 CC syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for  
 CC treating a patient having a condition associated with the level of ERG,  
 CC by contacting cells of the patient with (I) under conditions suitable for  
 CC the treatment. The method comprises the use of one or more therapies  
 CC under conditions suitable for the treatment. Leukaemia or tumour  
 CC angiogenesis is treated by administering (I) to the patient in  
 CC conjunction with one or more of other therapies such as radiation or  
 CC chemotherapy treatment. (I) is useful for reducing ERG activity in a  
 CC cell, by contacting the cell with (I). (I) is useful for cleaving RNA of  
 CC ERG gene, by contacting (I) with RNA, in the presence of a divalent  
 CC cation such as Mg2+. (I) is useful for diagnosis of conditions and  
 CC diseases related to the expression of ERG, and as diagnostic tool to  
 CC examine genetic drift and mutations within diseased cells or to detect  
 CC the presence of ERG RNA in a cell. (I) is useful for specifically  
 CC targeting genes that share homology with ERG gene or ERG fusion genes.  
 CC ABK17354-ABK22719 represent nucleic acids, including antisense and  
 CC enzymatic nucleic acid molecules which regulate expression of ERG, and  
 CC related PCR primers of the invention

 XX Novel polynucleotide which down regulates expression of Ets-related gene,  
 PT useful for treating cancer, diabetic retinopathy, macular degeneration,  
 PT arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.  
 XX  
 PS Claim 4; Page 120; 149pp; English.  
 XX  
 XX The invention relates to a nucleic acid molecule (I) which down regulates  
 CC expression of an Ets-related gene (ERG). (I) is useful for treating  
 CC conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma,  
 CC tumour angiogenesis, diabetic retinopathy, macular degeneration,  
 CC neovascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca  
 CC vulgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge  
 CC Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-rendu  
 CC syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for  
 CC treating a patient having a condition associated with the level of ERG,  
 CC by contacting cells of the patient with (I) under conditions suitable for  
 CC the treatment. The method comprises the use of one or more therapies  
 CC under conditions suitable for the treatment. Leukaemia or tumour  
 CC angiogenesis is treated by administering (I) to the patient in  
 CC conjunction with one or more of other therapies such as radiation or  
 CC chemotherapy treatment. (I) is useful for reducing ERG activity in a  
 CC cell, by contacting the cell with (I). (I) is useful for cleaving RNA of  
 CC ERG gene, by contacting (I) with RNA, in the presence of a divalent  
 CC cation such as Mg2+. (I) is useful for diagnosis of conditions and  
 CC diseases related to the expression of ERG, and as diagnostic tool to  
 CC examine genetic drift and mutations within diseased cells or to detect  
 CC the presence of ERG RNA in a cell. (I) is useful for specifically  
 CC targeting genes that share homology with ERG gene or ERG fusion genes.  
 CC ABK17354-ABK22719 represent nucleic acids, including antisense and  
 CC enzymatic nucleic acid molecules which regulate expression of ERG, and  
 CC related PCR primers of the invention

XX
XX PT Antibodies which selectively bind mammalian Ob receptors and inhibits the
XX binding of leptin to the mammalian Ob receptor, useful for diagnosing and
XX treating weight disorders.
XX
XX PS Example; Col 62; 108pp; English.
XX
XX CC The present invention relates to novel antibodies which selectively bind
XX mammalian Ob receptors (ObR) and inhibit the binding of leptin to the
XX mammalian Ob receptor. ObR sequences are novel receptor proteins that
XX participate in the control of mammalian body weight. The antibodies of
XX the invention may be used to detect of Ob receptor in a biological sample
XX and utilised as a part of diagnostic or prognostic technique in which
XX patients may be tested for abnormal amounts of Ob receptors. They may be
XX utilised in conjunction with, for example, compound screening schemes for
XX the evaluation of the effect of test compounds on expression and/or
XX activity of the Ob receptor gene product. The antibodies can be used in
XX conjunction with the gene therapy techniques, for example, to evaluate
XX the normal and/or engineered Ob receptor-expressing cells prior to their
XX introduction into the patient. They may be used in the method for the
XX screening, clinical trial monitoring and/or the treatment of body weight
XX disorders including but not limited to obesity, cachexia and anorexia.
XX The present DNA sequence is a PCR primer which is used for amplifying
XX mouse ObR genomic DNA. This sequence is used in the exemplification of
XX the invention

XX New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

XX Claim 23; SEQ ID NO 15011; 495pp; English.

XX The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNazyme, and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2'-O-methyl modifications, phosphorothioate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid molecule of the invention

PT	New nucleic acid molecule that modulates replication of West Nile Virus
PT	(WNV), useful for treating a condition related to WNV infection e.g.
PT	pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
XX	
PS	Claim 23; SEQ ID NO 8976; 495pp; English.
XX	
CC	The invention relates to nucleic acid molecules that modulate replication
CC	of the West Nile Virus (WNV). The nucleic acid molecules are useful for
CC	treating a condition related to WNV infection e.g. pancreatitis,
CC	encephalitis, myocarditis, meningitis, neurologic infection, hepatitis,
CC	liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid
CC	molecule is selected from the group of ribozymes consisting of
CC	Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The
CC	nucleic acid molecules further comprise at least five ribose residues, at
CC	least ten 2'-O-methyl modifications, phosphorothioate linkages on at
CC	least three of the 5' terminal nucleotides and a 3' end modification of a
CC	3'-3', inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080
CC	are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given
CC	in the specification. The present sequence is that of a nucleic acid
CC	molecule of the invention

CC	least three of the 5' terminal nucleotides and a 3' end modification of
CC	3'-3', inverted basic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080
CC	are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given
CC	in the specification. The present sequence is that of a nucleic acid
CC	molecule of the invention

CC	The invention relates to a novel isolated 17 mer nucleic acid sequence,
CC	given in the specification, a sequence containing at least 15 consecutive
CC	nucleotides from the 17 mer sequence, a sequence with, after optimal
CC	alignment, at least 80 % identity to the 17 mer sequence, a sequence that
CC	hybridizes to them under highly stringent conditions, or the complement
CC	of any of them, or the corresponding RNA. The novel isolated nucleic
CC	acids of the invention are useful as probes and primers for detecting,
CC	identifying, quantifying and/or amplifying a nucleic acid, e.g. as one
CC	component of a gene chip, in vitro as (anti)sense reagents, and for
CC	production of recombinant polypeptides. Any of the nucleic acids,
CC	polypeptides, vectors containing the nucleic acids, cells containing the
CC	vector or antibodies directed against the polypeptides are useful for
CC	preparation of pharmaceuticals for prevention and/or treatment of viral
CC	diseases that are characterised by development of tumours or cell
CC	degeneration, specifically cancer but also Alzheimer's disease and
CC	schizophrenia. Analysis of the expression of the 17 mer nucleic acids in
CC	patient samples is useful for diagnosis and/or prognosis of these
CC	diseases. The polypeptides can also be used to generate antibodies, and
CC	both the polypeptide and antibodies are useful as components of protein

CC chips. The nucleic acid sequences of the invention can be used in gene  
CC therapy. This polynucleotide sequence represents a tumour suppression

PS Claim 3; Page 29; 72pp; English.
XX
CC The invention describes an enzymatic nucleic acid molecule (I) which down
CC regulates expression of a sequence encoding a subunit of nuclear factor
CC kappa B (NFKB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme
CC configuration. The enzymatic nucleic acid molecule is adapted to treat
CC cancer and is useful for down-regulating REL-A activity in a cell, for
CC treating a patient having a condition associated with the level of REL-A.
CC (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in
CC the presence of a divalent cation, especially Mg2+. The enzymatic and
CC antisense nucleic acid molecules are useful for treating breast, lung,
CC prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic,
CC cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or
CC multidrug resistant cancer. The method involves use of other drug
CC therapies such as monoclonal antibodies, REL-A-specific inhibitors or
```

CC chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate,  
 CC cyclophosphamide, doxorubicin, fluorouracil carboplatin, edatrexate,  
 CC gemcitabine or radiation therapy. The enzymatic and antisense nucleic  
 CC acid molecules are also useful for treating inflammatory disease such as  
 CC rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes,  
 CC obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft  
 CC rejection, gene therapy applications, ischaemia/reperfusion injury  
 CC (central nervous system (CNS) and myocardial), glomerulonephritis,  
 CC sepsis, allergic airway inflammation, inflammatory bowel disease or  
 CC infection. This sequence represents the substrate of a novel enzymatic  
 CC nucleic acid molecule

 XX  
 CC The invention describes an enzymatic nucleic acid molecule (I) which down  
 CC regulates expression of a sequence encoding a subunit of nuclear factor  
 CC kappa B (NFkB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme  
 CC configuration. The enzymatic nucleic acid molecule is adapted to treat  
 CC cancer and is useful for down-regulating REL-A activity in a cell, for  
 CC treating a patient having a condition associated with the level of REL-A.  
 CC (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in  
 CC the presence of a divalent cation, especially Mg<sup>2+</sup>. The enzymatic and  
 CC antisense nucleic acid molecules are useful for treating breast, lung,  
 CC prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic,  
 CC cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or  
 CC multidrug resistant cancer. The method involves use of other drug  
 CC therapies such as monoclonal antibodies, REL-A-specific inhibitors or  
 CC chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate,  
 CC cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate,  
 CC gemcitabine or radiation therapy. The enzymatic and antisense nucleic  
 CC acid molecules are also useful for treating inflammatory disease such as  
 CC rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes,  
 CC obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft  
 CC rejection, gene therapy applications, ischaemia/reperfusion injury  
 CC (central nervous system (CNS) and myocardial), glomerulonephritis,  
 CC sepsis, allergic airway inflammation, inflammatory bowel disease or  
 CC infection. This sequence represents the substrate of a novel enzymatic  
 CC nucleic acid molecule

PT associated with decreased or increased expression or activity of MDZ3,  
 PT MDZ4, MDZ7 or MDZ12, e.g. cancer.  
 XX  
 PS Example 8; SEQ ID NO 5252; 103pp; English.  
 XX  
 CC The present invention relates to novel human zinc finger-containing  
 CC proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is  
 CC encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2,  
 CC MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome  
 CC 15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy,  
 CC or in manufacturing a medicament for treating or preventing a disorder  
 CC associated with decreased or increased expression or activity of MDZ3,  
 CC MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic  
 CC acids and proteins are also useful for diagnosing or monitoring a disease  
 CC caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic  
 CC acids can also be used as probes to detect and characterize gross  
 CC alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are  
 CC useful in constructing microarrays for measuring gene expression. The  
 CC proteins are useful as therapeutic agents for gene therapy or as  
 CC vaccines. The present sequence was used to illustrate the invention.

 PT New zinc finger-containing proteins and nucleic acids, useful in  
 PT manufacturing a medicament for treating or preventing a disorder  
 PT associated with decreased or increased expression or activity of MDZ3,  
 PT MDZ4, MDZ7 or MDZ12, e.g. cancer.  
 XX  
 PS Example 8; SEQ ID NO 3399; 103pp; English.

XX The present invention relates to novel human zinc finger-containing  
 CC proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is  
 CC encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2,  
 CC MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome  
 CC 15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy,  
 CC or in manufacturing a medicament for treating or preventing a disorder  
 CC associated with decreased or increased expression or activity of MDZ3,  
 CC MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic  
 CC acids and proteins are also useful for diagnosing or monitoring a disease  
 CC caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic  
 CC acids can also be used as probes to detect and characterize gross

CC alterations in MD23, MD24, MD27, or MD212 genetic locus. The probes are  
CC useful in constructing microarrays for measuring gene expression. The  
CC proteins are useful as therapeutic agents for gene therapy or as  
CC vaccines. The present sequence was used to illustrate the invention.

PT Novel short interfering RNA and enzymatic nucleic acid useful for  
PT treating cancer, modulates the expression of a nucleic acid encoding  
PT HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.  
XX  
PS Claim 4; Page 152; 185pp; English.  
XX  
CC The invention relates to a novel short interfering RNA (siRNA) nucleic  
CC acid molecule or an enzymatic nucleic acid molecule, that modulates  
CC expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras,  
CC human immunodeficiency virus (HIV) or a component of HIV. The nucleic  
CC acid molecule of the invention has cytostatic, anti-HIV, and anti-  
CC rheumatic activity. The nucleic acid molecules are useful for reducing  
CC HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are  
CC also useful for treating breast, ovarian, colorectal, lung, prostate,  
CC bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences  
CC shown in ABZ5989 - ABZ62216, ABZ64544 - ABZ65531, ABZ66520 - ABZ66524,  
CC ABZ66530 - ABZ66585 represent substrate/target sequences for the human  
CC ribozymes of the invention

CC The present invention relates to nucleic acid molecules which modulate  
CC the synthesis, expression and/or stability of Hepatitis C virus (HCV) or  
CC Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense  
CC and enzymatic nucleic acids such as hammerhead ribozymes, DNzymes,  
CC inozymes, zinzymes, amberyne, and G-cleaver ribozymes. Also disclosed  
CC are nucleic acid decoy molecules and aptamers that bind to HBV reverse  
CC transcriptase and/or HBV reverse transcriptase primer sequences, as well  
CC as oligonucleotides that specifically bind the Enhancer I region of HBV  
CC DNA. The nucleic acids may be used to modulate the expression of HBV  
CC genes and HBV viral replication. Also disclosed is a method for screening  
CC compounds and/or potential therapies directed against HBV, and compounds  
CC that modulate the expression and/or replication of HCV. The compounds and  
CC methods of the invention are useful for the treatment of degenerative and  
CC disease states related to HBV and HCV infection, replication and gene

 XX  
 XX New isolated or recombinant polypeptide for use in modulating a plant  
 XX growth trait in a flowering plant e.g. in Arabidopsis, Brassica, Zea, or  
 XX Oryza.  
 XX  
 XX Example 2; SEQ ID NO 196; 81pp; English.  
 XX  
 XX The invention describes an isolated or recombinant polypeptide (I)  
 XX comprising a sequence: (a) comprising 1 of 30 sequences (S1), as given in  
 XX the specification, or a conservative variant; (b) encoded by 1 of 30  
 XX sequences (S2), as given in the specification, or a conservative variant;  
 XX (c) encoded by a sequence that hybridizes under stringent conditions to  
 XX S2; and (d) encoded by a sequence 70 % identical to S2. The expression or  
 XX activity of (I) is modulated to modulate a plant growth trait in a  
 XX flowering plant, of the family Brassicaceae, preferably in a plant that  
 XX is Arabidopsis, Brassica, Zea, Oryza, Triticum, Hordeum, Lolium, Sorghum,  
 XX Glycine, Medicago, Helianthus, Lactuca, Beta, Vitis, Solanum,  
 XX Lycopersicon, Capsicum, Gossypium, Hevea, Linum, Prunus, Citrus, Populus,  
 XX Pinus, or Quercus. A new method is used to detect genes for a plant  
 XX growth trait. This sequence represents a polynucleotide isolated from the  
 XX plant growth associated genes of the invention that can be used as a  
 XX primer, probe or genetic marker.

XX Novel enzymatic nucleic acid that down-regulates expression of neurite  
 PT growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or  
 PT protein kinase PKR genes, for treating cancer and inflammatory disease.

XX Claim 59; SEQ ID NO 2937; 317pp; English.

XX The invention comprises nucleic acids (e.g. antisense oligonucleotides)  
 CC that down regulate the expression or inhibit the function of a receptor  
 CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),  
 CC IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the  
 CC invention are useful for treating: cerebrovascular accident, central  
 CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,  
 CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,  
 CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune  
 CC disease, lupus, multiple sclerosis, transplant/graft rejection,  
 CC ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic  
 CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The  
 CC nucleic acids of the invention are also useful for down-regulating the  
 CC expression of a target gene and as a diagnostic tool to examine genetic  
 CC drifts and mutations within diseased cells or to detect the presence of a  
 CC target RNA in a cell. The present RNA sequence represents a human PKR  
 CC substrate sequence.

PT associated with the level of GRID, e.g. tissue/graft rejection and
PT leukemia.
XX XX
PS Claim 4; SEQ ID NO 440; 74pp; English.
XX XX
CC The invention relates to a nucleic acid molecule that down-regulates
CC expression of Grb2-related with insert domain (GRID) gene, e.g. a
CC hammerhead ribozyme, NCH ribozyme, G-cleaver ribozyme, Zinzyme, DNazyme,
CC amberyzyme, inozyme or hairpin ribozyme. Also include are a mammalian cell
CC including the novel nucleic acid molecule, reducing GRID activity in a
CC cell by contacting the cell with the novel nucleic acid molecule,
CC treating a patient having a condition associated with the level of GRID
CC (e.g. tissue/graft rejection or leukaemia) by contacting the cell with
CC the novel nucleic acid molecule, cleaving RNA of a GRID gene by
CC contacting the cell with the novel nucleic acid molecule, an expression
CC vector comprising a nucleic acid sequences (encoding at least the novel
CC nucleic acid molecule in a manner that allows its expression), a
CC mammalian cell including the expression vector and an enzymatic nucleic
CC acid molecule that cleaves RNA derived from a GRID gene. The nucleic acid
CC molecule is useful for treating a condition associated with the level of
CC GRID, e.g. tissue/graft rejection and leukaemia. The present sequence is
CC a target region for the enzymatic nucleic acids of the invention.

 PT Pharmaceutical composition for treating asthma, has antisense  
 PT oligonucleotide containing less percentage of adenosine, targeted to  
 PT nucleic acids associated with lung airway or lung dysfunction, and  
 PT bronchodilating agent.  
 XX  
 PS Claim 15; SEQ ID NO 9413; 763pp; English.  
 XX  
 CC This invention describes a novel composition (a) a first active agent,  
 CC comprising oligonucleotides, effective for alleviating  
 CC bronchoconstriction, respiratory tract inflammation, allergies and  
 CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,  
 CC surfactant depletion or hyposcretion, when administered to a mammal. The  
 CC oligonucleotides are derived from a gene encoding or regulating  
 CC expression of a target polypeptide associated with lung airway or lung  
 CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.  
 CC The invention also describes a kit, that comprises: (a) a delivery  
 CC device, in separate containers, (b) the oligonucleotides, (c)  
 CC instructions for adding a carrier and for use of the kit. The composition  
 CC of the invention has antiallergic, antiinflammatory, antiasthmatic,  
 CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a  
 CC beta-adrenergic agonist. The composition is useful for preventing or  
 CC treating a respiratory, lung or malignant disease. The administered  
 CC composition comprises oligo and is administered to reduce the production  
 CC or availability, or to increase the degradation of the target mRNA or to  
 CC reduce the amount of target polypeptide present in the lungs. The  
 CC pulmonary obstruction, and/or bronchoconstriction and/or lung  
 CC inflammation, allergies and/or surfactant hypoproduction are associated  
 CC with a disease or condition such as pulmonary vasoconstriction,  
 CC inflammation, allergies, asthma, impeded respiration, respiratory  
 CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary  
 CC transplantation rejection, pulmonary infections, bronchitis or cancer.  
 CC The reduced adenosine content of the anti-sense oligos corresponding to  
 CC thymidines present in the target RNA serves to prevent the breakdown of  
 CC the oligonucleotides into products that free adenosine into the system  
 CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to  
 CC prevent any unwanted effects due to it

 PT Pharmaceutical composition for treating asthma, has antisense  
 PT oligonucleotide containing less percentage of adenosine, targeted to  
 PT nucleic acids associated with lung airway or lung dysfunction, and  
 PT bronchodilating agent.  
 XX  
 PS Claim 15; SEQ ID NO 10289; 763pp; English.  
 XX  
 CC This invention describes a novel composition (a) a first active agent,  
 CC comprising oligonucleotides, effective for alleviating  
 CC bronchoconstriction, respiratory tract inflammation, allergies and  
 CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,  
 CC surfactant depletion or hyposcretion, when administered to a mammal. The  
 CC oligonucleotides are derived from a gene encoding or regulating  
 CC expression of a target polypeptide associated with lung airway or lung  
 CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.  
 CC The invention also describes a kit, that comprises: (a) a delivery  
 CC device, in separate containers, (b) the oligonucleotides, (c)  
 CC instructions for adding a carrier and for use of the kit. The composition  
 CC of the invention has antiallergic, antiinflammatory, antiasthmatic,  
 CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a  
 CC beta-adrenergic agonist. The composition is useful for preventing or  
 CC treating a respiratory, lung or malignant disease. The administered  
 CC composition comprises oligo and is administered to reduce the production  
 CC or availability, or to increase the degradation of the target mRNA or to  
 CC reduce the amount of target polypeptide present in the lungs. The  
 CC pulmonary obstruction, and/or bronchoconstriction and/or lung  
 CC inflammation, allergies and/or surfactant hypoproduction are associated  
 CC with a disease or condition such as pulmonary vasoconstriction,  
 CC inflammation, allergies, asthma, impeded respiration, respiratory  
 CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary  
 CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary

CC transplantation rejection, pulmonary infections, bronchitis or cancer.  
 CC The reduced adenosine content of the anti-sense oligos corresponding to  
 CC thymidines present in the target RNA serves to prevent the breakdown of  
 CC the oligonucleotides into products that free adenosine into the system  
 CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to  
 CC prevent any unwanted effects due to it

XX PT New oligonucleotides, useful for treating allergy or asthma, viral and bacterial infections, and cancer, e.g. biliary tract cancer, breast cancer, cervical cancer.

XX Example; SEQ ID NO 59; 104pp; English.

XX The invention relates to a class of CpG immunostimulatory oligonucleotides containing a 5'TCG motif or a CG at or the 5' end that are useful for stimulating an immune response. Oligonucleotides and compositions of the invention are useful for treating allergy or asthma, viral and bacterial infections and cancer e.g. biliary tract cancer, endometrial cancer, cervical cancer, lymphomas, intraepithelial neoplasms, liver cancer, lung cancer (e.g. small cell and non-small cell), melanoma, neuroblastomas, ovarian cancer, pancreatic cancer, prostate cancer, rectal cancer, sarcomas, thyroid cancer, renal cancer, bone cancer, brain and CNS cancer, connective tissue cancer, oesophageal cancer, eye cancer, Hodgkin's lymphoma, larynx cancer, oral cavity cancer, skin cancer, testicular cancer, as well as other carcinomas and sarcomas. The invention is also useful in gene therapy. The present sequence is a CpG immunostimulatory oligonucleotide.

XX
XX Novel myosin-like protein-1, useful for treating or preventing disorder
PT associated with decreased expression or activity of human genome-derived
PT myosin-like protein-1 such as disorder of heart and/or skeletal muscle
PT function.
XX
XX Disclosure; SEQ ID NO 8661; Opp; English.
XX
XX The invention relates to a novel polypeptide (I) comprising a sequence
CC (S1) of myosin-like protein-1 (hGDMLP-1) having 2568 amino acids fully
CC defined in the specification, a fragment of at least 8 amino acids of
CC (S1), 95% deviation from (S1) which are conservative substitutions, and
CC 65% identity to (S1). A polypeptide of the invention acts as an agonist or
CC antagonist of hGDMLP-1, or as an inhibitor of hGDMLP-1 activity. A
CC pharmaceutical composition of the invention is useful for treating or
CC preventing a disorder associated with decreased expression or activity of
CC hGDMLP-1, such as a disorder of heart and/or skeletal muscle function.
CC The present sequence represents a 17-mer nucleotide, used in the
CC invention for scanning the sequence represented in ACN63103

 PS Claim 17; Page 15; 162pp; English.  
 XX  
 CC The present invention describes an isolated human period (Drosophila)  
 CC homologue 1, (PER1) polynucleotide (I) comprising a sequence which is a  
 CC polymorphic variant for a reference sequence (ABL52077) for the PER1 gene  
 CC or its fragment, or a polymorphic variant of a reference sequence  
 CC (ABL52078) for a PER1 cDNA or its fragment. The present invention also  
 CC describes methods for genotyping and haplotyping the PER1 gene of an  
 CC individual. (I) is useful in studying the expression and function of  
 CC PER1, and in expressing PER1 protein for use in screening for candidate  
 CC drugs to treat diseases related to PER1 activity. (I) is useful for  
 CC therapeutic purposes. A recombinant non-human organism transformed or  
 CC transfected with (I) can be used for studying expression of the PER1  
 CC isogenes in vivo, for in vivo screening and testing of drugs targeted  
 CC against PER1 protein, and for testing the efficacy of therapeutic agents  
 CC and compounds for disorders associated with circadian rhythm regulation.  
 CC The present sequence represents an allele specific oligonucleotide primer  
 CC for human PER1, which is used in the exemplification of the present  
 CC invention

 XX  
 PS Claim 14; Page 14; 137pp; English.  
 XX  
 CC The present invention describes genetic variants of the human glutathione  
 CC reductase (GSR) gene (I). (I) has antianaemic activity and can be used in  
 CC gene therapy. (I) can be used in screening for drugs targeting (I) that  
 CC are useful for treating haemolytic anaemia. Methods from the present  
 CC invention can be used: for improving the efficiency and reliability of  
 CC several steps in the discovery and development of drugs for treating  
 CC diseases associated with GSR activity; for haplotyping, which is also  
 CC used by the pharmaceutical research scientist to validate GSR as a  
 CC candidate target for treating a specific condition or disease predicted  
 CC to be associated with GSR activity, e.g. haemolytic anaemia, and in the  
 CC design of clinical trials for treating a specific condition of disease  
 CC associated with GSR activity; and for screening compounds targeting GSR.  
 CC (I) is useful in studying the expression and function of GSR, and in  
 CC expressing GSR protein for use in screening for candidate drugs to treat  
 CC diseases related to GSR activity. (I) is also useful in studying the  
 CC effect of the variation on the biological activity of GSR as well as on  
 CC the binding affinity of candidate drugs targeting GSR for the treatment  
 CC of haemolytic anaemia. The present sequence represents an allele specific  
 CC oligonucleotide (ASO) primer for the human GSR gene, which is given in  
 CC the exemplification of the present invention. N.B. The polymorphic base  
 CC (showing a single nucleotide polymorphism) in the ASO primer is shown  
 CC using an IUPAC ambiguity code (as given in the present invention)

XX PA (GENA-) GENAISSANCE PHARM INC.  
 XX PI Bentivegna SC, Chew A, Choi JY, Denton RR, Nandabalan K;  
 XX DR WPI; 2002-055250/07.  
 XX PT New polymorphic variants comprising interleukin-8 receptor beta (IL8RB)  
 PT isogene, useful in expressing IL8RB protein for use in screening for  
 PT candidate drugs to treat diseases related to IL8RB activity, e.g.  
 PT inflammatory disorders.  
 XX PS Claim 16; Page 13; 74pp; English.  
 XX CC The invention relates to single nucleotide polymorphisms in the human  
 CC interleukin 8 receptor beta (IL8RB) gene. A method for haplotyping the  
 CC IL8RB gene in an individual comprises identifying the nucleotide at one  
 CC or more polymorphic sites and determining whether one of the copies of  
 CC the gene is defined by one of the IL8RB haplotypes given in the  
 CC specification or whether both copies are defined by a haplotype pair.  
 CC This method is useful in genotyping, whereby all possible haplotype pairs  
 CC can be assigned to specific genotypes. An association between a trait and  
 CC a haplotype or haplotype pair of the IL8RB gene can be identified by  
 CC comparing the frequency of the haplotype or haplotype pair in a  
 CC population exhibiting the trait with the frequency of the haplotype or  
 CC haplotype pair in a reference population, where a higher haplotype  
 CC frequency in the trait population indicates the trait is associated with  
 CC the haplotype or haplotype pair. IL8RB and its corresponding DNA are used  
 CC for studying the expression and function of IL8RB, for use in screening  
 CC for candidate drugs to treat diseases related to IL8RB activity, such as  
 CC chronic obstructive pulmonary disease and other inflammatory disorders.  
 CC The sequences are also useful for studying the effect of variation on the  
 CC biological activity of IL8RB as well as on the binding affinity of  
 CC candidate drugs targeting IL8RB. Sequences AAS95525-AAS95579 represent  
 CC allele-specific oligonucleotide probes, sequencing primers and PCR  
 CC primers used to detect IL8RB gene polymorphisms

 XX PT Amyloid beta precursor protein binding protein 159 kD (APPBP1) gene  
 PT polymorphic variants, useful e.g. in studying the expression and function  
 PT of APPBP1 and screening candidate drugs for treating Alzheimer's disease.  
 XX PS Claim 17; Page 13; 104pp; English.  
 XX CC The invention relates to an isolated polypeptide comprising a sequence  
 CC which is a polymorphic variant of a reference sequence for the amyloid  
 CC beta precursor protein binding protein 1, 59kD (APPBP1) protein or its  
 CC fragment. The polymorphic variants are useful in studying the expression  
 CC and function of APPBP1, in expressing APPBP1 protein for use in screening  
 CC for candidate drugs to treat diseases related to APPBP1 activity, in  
 CC studying the effect of the variation on the biological activity of  
 CC APPBP1, and the binding affinity of candidate drugs targeting APPBP1 for  
 CC the treatment of disorders such as Alzheimer's disease. The haplotyping  
 CC methods are useful in validating APPBP1 as a candidate target for  
 CC treating a specific condition or disease predicted to be associated with  
 CC APPBP1 activity, or in the design of clinical trials of candidate drugs  
 CC for treating a specific condition or disease associated with APPBP1  
 CC activity. The transgenic animals are useful for studying expression of  
 CC the APPBP1 isogenes in vivo, for in vivo screening and testing of drugs  
 CC targeted against APPBP1 protein, and for testing the efficacy of  
 CC therapeutic agents and compounds for disorders related to platelet  
 CC aggregation in a biological system. ABK32771-ABK32327 represent human  
 CC APPBP1 gene allele-specific oligonucleotides used in the method of the  
 CC invention
